January 28, 2020

Reference No. 11203044

Ms. Caitlin Aitchison
SRM Architects Inc.
279 King Street West, Suite 200
Kitchener, Ontario N2G 1B1

Dear Ms. Aitchison:

**Re: Transportation Study
Proposed Mixed-Use Residential Development
1107 Main Street West, City of Hamilton**

GHD is pleased to submit the enclosed Transportation Study for the proposed mixed-use residential development located at 1107 Main Street West, south side of Main Street West and between Cline Avenue South and Dow Avenue in the City of Hamilton.

The purpose of this study is to determine the traffic-related impacts on the roadway system due to the proposed development traffic, and is also to determine adequate parking and appropriate Transportation Demand Management measures and to demonstrate that the subject site has adequate pedestrian, transit and cycling linkages to existing/proposed infrastructure.

The proposed development, at full build-out, is expected to consist of one 15-storey building containing 310 residential rental units with 5,760.3 ft² (535.1 m²) gross floor area (GFA) of commercial at grade.

There are 234 parking spaces provided consisting of 226 parking stalls on 3 levels of underground parking and 8 on-street spaces. Vehicular access will be provided by two full-move driveways: one on Cline Avenue for resident and visitor vehicles, and the other on Dow Avenue for loading and garbage trucks.

For study purposes, the proposed development is expected to be completed in 2022. Therefore, the study horizon is 2027, five years beyond build-out.

The proposed development is adjacent to the Main/King/Queenston B-Line LRT corridor. Metrolinx has identified the development of this LRT line in Hamilton linking McMaster University, Downtown and Eastgate Square as a top transit priority in the Regional Transportation Plan – The Big Move and the Province of Ontario has approved the Environmental Project Report (EPR) for the LRT project. Early construction could commence in 2020, with major LRT construction in 2021.

This study concludes that the proposed development can be accommodated by the abutting street system with the future LRT Line. Traffic generated by the proposed development does not add adverse impacts on the nearby road network and no road improvements are triggered as a result of this development.

The parking review indicates that the proposed parking supply of 234 spaces will meet the City's By-law requirements for the residents and can accommodate the anticipated visitor parking demand with spaces to spare.

We trust the enclosed is sufficient for your needs, but please do not hesitate to contact the undersigned should you require any additional assistance.

Sincerely,

GHD

Senior Transportation Manager

Executive Summary

- 1) The purpose of this report is to determine the traffic-related impacts on the roadway system from the proposed mixed-use residential development located at 1107 Main Street West, generally south of Main Street West and between Cline Avenue South and Dow Avenue in the City of Hamilton. It is also to determine the appropriate Transportation Demand Management measures and to demonstrate that the subject site has adequate pedestrian, transit and cycling linkages to existing/proposed infrastructure.
- 2) The proposed development, at full build-out, is expected to consist of 310 residential rental units with 5,760.3 ft² (535.1 m²) gross floor area (GFA) of commercial at grade. There are 234 parking spaces provided consisting of 226 parking stalls on 3 levels of underground parking and 8 on-street spaces. Vehicular access will be provided by two full-move driveways: one on Cline Avenue for resident and visitor vehicles, and the other on Dow Avenue for loading and garbage trucks.
- 3) The study intersections for capacity analysis are:
 - Main Street West at Cline Avenue South;
 - Main Street West at Dow Avenue; and
 - Cline Avenue South at Site Access.
- 4) Recent weekday turning movement counts were conducted by Ontario Traffic Inc. on September 17, 2019 at the existing study intersections of Main Street West / Cline Avenue South and Main Street West / Dow Avenue.
- 5) For study purposes, the proposed development is expected to be completed in 2022. Therefore, the study horizon is 2027, five years beyond build-out.
- 6) The proposed development is adjacent to the Main/King/Queenston B-Line LRT corridor. Metrolinx has identified the development of this LRT line in Hamilton linking McMaster University, Downtown and Eastgate Square as a top transit priority in the Regional Transportation Plan – The Big Move and the Province of Ontario has approved the Environmental Project Report (EPR) for the LRT project.
- 7) Based on a review of the available “City of Hamilton Rapid Transit Initiative Acoustic Assessment Report-Final” prepared by Dillon Consulting Limited, the Dillon’s study estimated the PM peak hour volumes for year 2031 with LRT conditions along Main Street West within the study area, which assumed an applied annual growth rates of 0.73% from 2008 to the 2031 horizon. To be conservative, this analysis applied an annual growth rate of 1.0% to all movements to estimate the background traffic growth for the 2027 study horizon.
- 8) Subject site vehicular trips were estimated based on the average trip rates as well as based on trip rates derived from the fitted curve equations of High-Rise Multifamily House (LUC #222) provided by Trip Generation, 10th Edition, published by the Institute of Transportation Engineers (ITE). The resultant trip rates, entering and exiting proportions, and estimated total site trips are summarized in the table below:

Site Development	Units	Parameter	Peak Hour Trip Generation					
			Weekday AM Peak			Weekday PM Peak		
			In	Out	Total	In	Out	Total
Residential (High-Rise Multifamily House)	310	Gross Rate (Average Rate)	0.07	0.24	0.31	0.22	0.14	0.36
		New Trips	23	73	96	68	44	112
	310	Gross Rate (Fitted curve equation)	0.077	0.246	0.323	0.224	0.144	0.368
		New Trips	24	76	100	70	44	114

To be conservative, this analysis applied the higher trips (derived from the fitted curve equation) of the High-Rise Multifamily House.

As a residential rental apartment building, the proposed commercial component provides services predominately to the local residents / students, and therefore it is not expected to generate any vehicular trips.

Although there could be an allowance for transit and active transportation modes, trip reductions were not considered in this analysis to be conservative. Accordingly, the total new site trips are expected to be 100 two way trips during the weekday AM peak hour and 114 two way trips during the weekday PM peak hour.

- 9) The study concludes that the proposed development can be accommodated by the abutting street system with the future LRT Line. Traffic generated by the proposed development does not add adverse impacts on the nearby road network and no road improvements are triggered as a result of this development.
- 10) The City of Hamilton's current parking By-Law requires 181 parking spaces for the residents of the development. The City does not provide a requirement for visitor parking.

For visitor parking requirements, according to the parking surveys in Durham Region, the visitor parking demand is 0.091 per residential unit. Similarly, for example, in the City of Toronto, By-Law # 569-2013 requires 0.10 visitor parking space per dwelling unit for an apartment building. Therefore, the expected required number of visitor parking spaces is in the range of 28 and 31 for the proposed development assuming these rates.

The estimated total parking requirement for the proposed development will be 212 (181 resident +31 visitor) parking spaces.

- 11) Therefore, the proposed parking supply of 234 spaces will meet Hamilton's By-law requirements for resident p and can accommodate the visitor parking demand with an estimated surplus of 22 parking spaces. The Circulation Review confirms that the proposed site plan is sufficient to accommodate the circulation requirements of garbage trucks as well as medium single unit trucks. The proposed parking level plans are sufficient to accommodate circulation requirements of the passenger car design vehicles illustrated in (Appendix H).
- 12) Hamilton Street Railway (HSR) Transit currently provides bus service along Main Street West in the study area with Routes 5 and 10. Route 5 (Delaware) stops at the intersections of Main Street / Dow

Avenue and Main Street / Haddon Avenue. Route 10 (B Line Express) stops at the intersections of Main Street / Emerson Street and Main Street / Longwood Road.

- 13) The site's residents can easily access to the surrounding pedestrian network and transit system along Main Street West via sidewalks on Cline Avenue and Dow Avenue.
- 14) It is possible that through transit ridership, cycling, and carpooling to reduce auto-dependency since all or a combination of these Transportation Demand Management (TDM) practices can be implemented. With the implementation of the suggested TDM measures, the overall subject site generated trips could be reduced by approximately 17 trips (15% to 17%).

1. Introduction

1.1. Retainer and objective

GHD was retained by 1107 Main Inc. to prepare a Transportation Study to determine the transportation related impacts on the roadway system from the proposed development. It is also to determine the appropriate Transportation Demand Management measures and to demonstrate that the subject site has adequate pedestrian, transit and cycling linkages to existing/proposed infrastructure.

The proposed development is located at 1107 Main Street West, generally south of Main Street West and between Cline Avenue South and Dow Avenue in the City of Hamilton. The site location is shown in Figure 1.

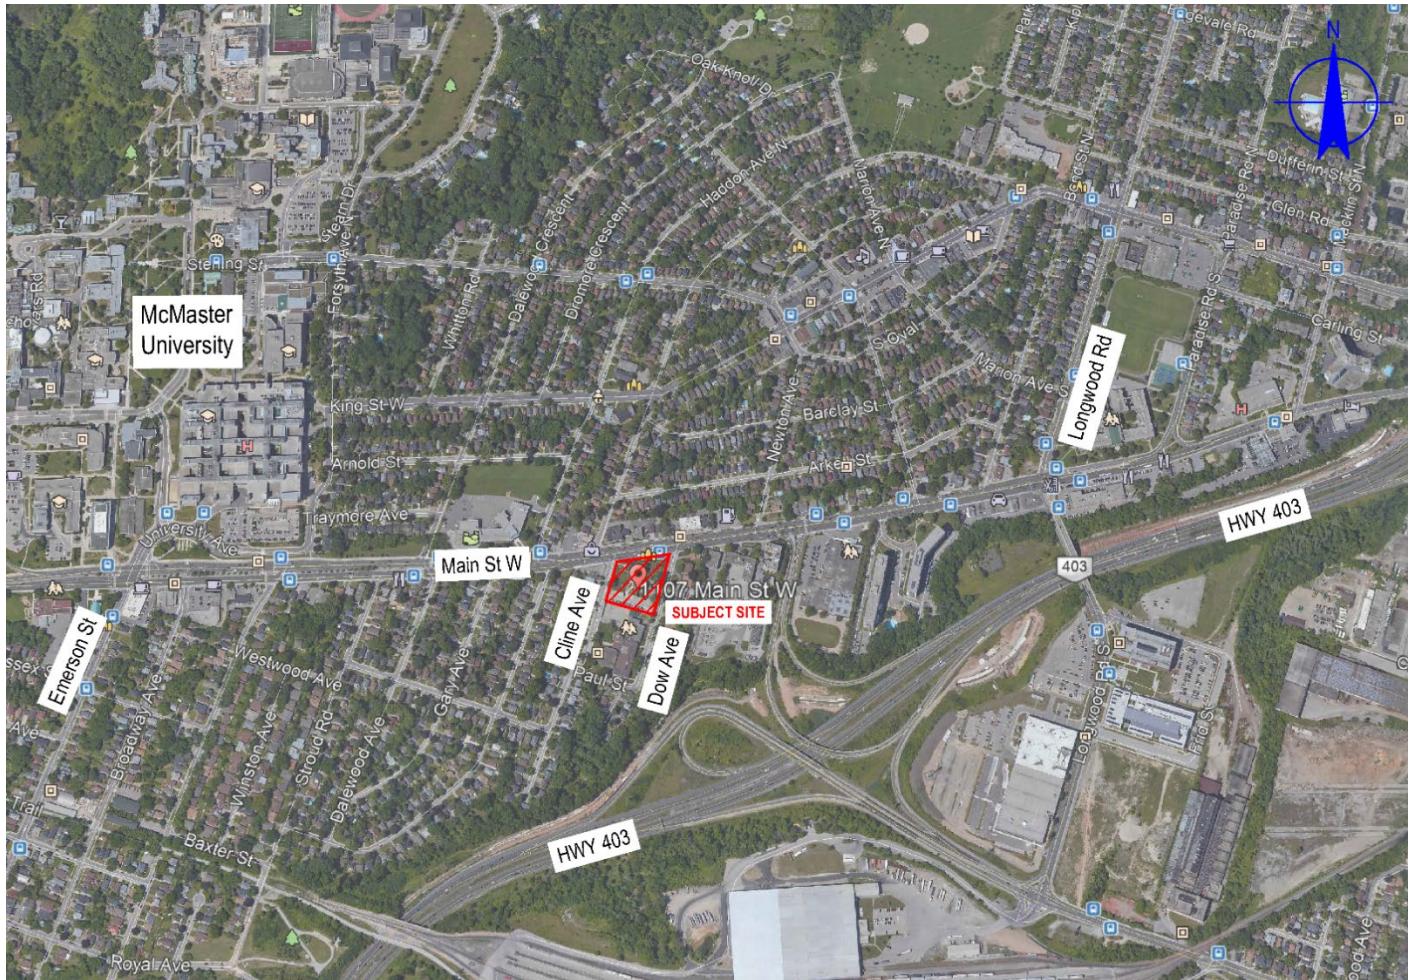

Figure 1 Site location

1.2. Study background

The subject site currently is the Grace Evangelical Lutheran Church. The proposed residential development is expected to consist of 310 residential rental units with 5,760.3 ft² (535.1 m²) gross floor area (GFA) of commercial at grade. There are 234 parking spaces provided consisting of 226 parking stalls on 3 levels of underground parking and 8 on-street parking spaces. Figure 2 shows the proposed Site Plan of the development and site access / roadway scheme. As shown in Figure 2, vehicular access to the site will be provided by two full-move driveways: one on Cline Avenue for resident and visitor vehicles, and the other on Dow Avenue for loading and garbage trucks.

For study purposes, the proposed development is expected to be completed in 2022. Therefore, the study horizon is 2027, five years beyond build-out.

The proposed development is adjacent to the Main/King/Queenston B-Line LRT corridor. Metrolinx has identified the development of this LRT line linking McMaster University, Downtown and Eastgate Square as a top transit priority in the Regional Transportation Plan – The Big Move and the Province of Ontario has approved the Environmental Project Report (EPR) for the LRT project.

In the study area, Main Street West currently contains two westbound traffic lanes and three eastbound traffic lanes as well as a centre bi-directional left turning lane. Under the proposed LRT design, this section of Main Street West would still contain two westbound traffic lanes and three eastbound traffic lanes however no centre turning lane. The LRT guideway would be located between westbound and eastbound traffic lanes.

Crossings of the LRT guideway outside of signalized intersections will not be permitted. Eastbound traffic on Main Street West would be able to turn right onto Cline Avenue South or onto Dow Avenue. Vehicles exiting the subject lands in a northerly direction would be able to turn right onto eastbound Main Street. Westbound traffic accessing the subject lands must make a U-turn where permitted at signalized intersections west of the subject lands in order to turn around and access the subject lands in an eastbound direction at Cline Avenue. Similarly, vehicles leaving the subject lands in order to travel westbound on Main Street West will have to travel east on Main Street West until an approved U-turn location.

This study establishes the existing traffic volumes and operating conditions for the weekday AM and PM peak hour periods (the critical periods for traffic for residential uses), derives and assesses the future background traffic growth, estimates and assigns new site traffic volumes, and documents the expected site-related impacts on the road network with the future LRT Line. The study also reviews the parking supply and site circulation plans, and determines the appropriate Transportation Demand Management measures.

Our findings, conclusions and recommendations are contained herein.

1.3. Study team

The project team members involved in the preparation of this study are:

- Mr. Roland Roovers, P.Eng., Senior Transportation Manager, and
- Mr. Hong Shen, M.Eng., P.Eng., Transportation Project Engineer.

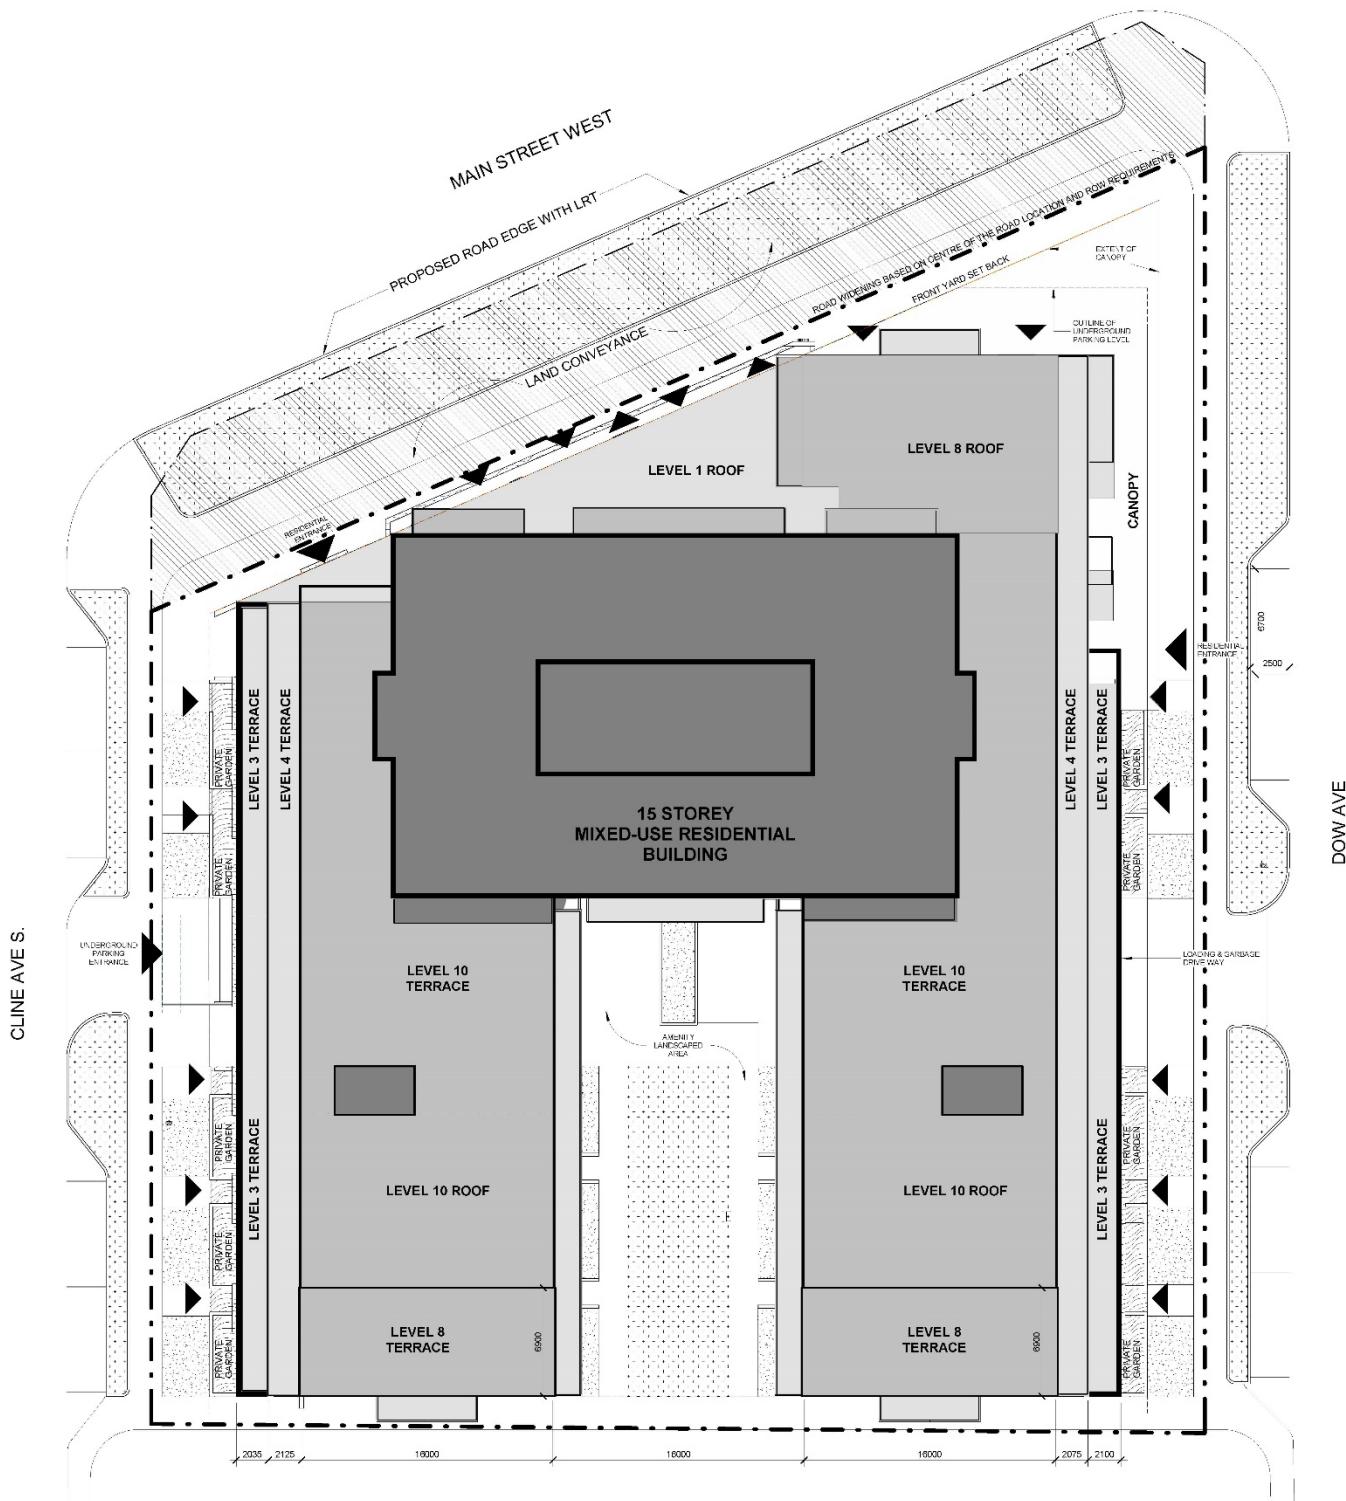

Figure 2 Site plan

2. Site characteristics

2.1 Site environs

The subject site currently is the Grace Evangelical Lutheran Church, generally bounded by Main Street West to the north, office / commercial land use to the south, Cline Avenue to the west, and Dow Avenue to the east in the City of Hamilton, as shown in Figure 1.

The site has opportunities to access the surrounding arterial street and transit systems. Access to the subject site will be provided by two accesses: one on Cline Avenue for resident and visitor vehicles, and the other on Dow Avenue for loading and garbage trucks. The distance along Main Street West between Cline Avenue and University Avenue (within McMaster University) is approximately 700 metres.

The study area includes the following intersections:

- Main Street West at Cline Avenue South;
- Main Street West at Dow Avenue; and
- Cline Avenue South at Site Access.

2.2 Site plan

The proposed development, at full build-out, is expected to consist of 310 residential rental units with 5,760.3 ft² (535.1 m²) gross floor area (GFA) of commercial uses at grade.

There are 234 parking spaces provided consisting of 226 parking stalls on 3 levels of underground parking and 8 on-street spaces.

For study purposes, the proposed development is expected to be completed in 2022. Therefore, the study horizon is 2027, five years beyond build-out.

Figure 2 shows the concept of the proposed development.

3. Existing conditions

3.1 Existing road network

The following describes the existing road infrastructure in the study area. The existing lane configurations and traffic controls of the study intersections are shown in Figure 3.

Main Street West

Main Street West is an east-west Major Arterial road under the jurisdiction of the City of Hamilton, with a posted speed limit of 60 km/hr in the vicinity of the subject site. It currently has a six-lane cross-section consisting of two westbound traffic lanes, three eastbound traffic lanes and a centre two-way left turn lane in the study area. There are sidewalks provided along both sides of the road.

The Main Street West intersections with Cline Avenue and Dow Avenue are stop controlled at Cline Avenue and Dow Avenue, respectively.

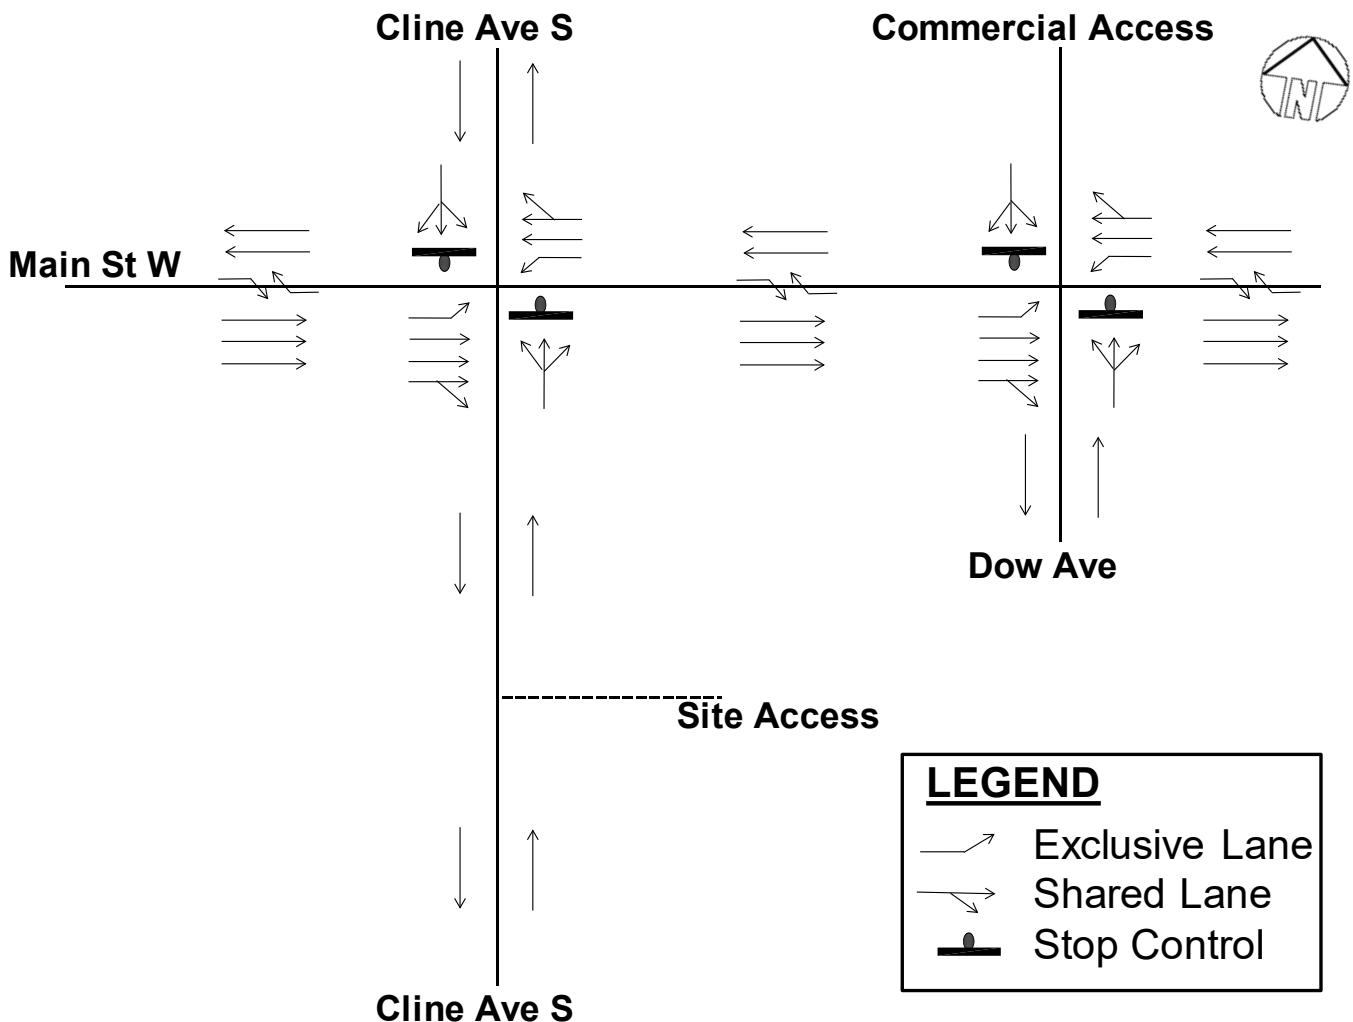

Figure 3 Existing lane configurations

Cline Avenue South

Cline Avenue South is a local road under the jurisdiction of the City of Hamilton with a posted speed limit of 40 km/hr in the vicinity of the subject site. It has a 2-lane cross-section with sidewalks provided along both sides of the road in the study area.

Dow Avenue

Dow Avenue is a local road under the jurisdiction of the City of Hamilton with a posted speed limit of 40 km/hr in the vicinity of the subject site. It has a 2-lane cross-section with sidewalks provided along both sides of the road in the study area.

3.2 Existing traffic data

In order to assess the traffic volumes during the busiest travel periods (weekday AM and PM peak hours), the recent turning movement counts were conducted by Ontario Traffic Inc. on Tuesday, September 17, 2019 at the existing study intersections of Main Street West / Cline Avenue South and Main Street West / Dow Avenue.

Figure 4 shows the most recent traffic volumes for weekday AM and PM peak hours at the study area intersections. The traffic data are provided in Appendix A.

3.3 Transit Data

Hamilton Street Railway Transit

Hamilton Street Railway (HSR) Transit currently provides bus service along Main Street West in the study area via Routes 5 and 10.

Route 5 – Delaware is the longest route in the HSR system, travelling a total of 44.4 km. The farthest westerly point is at the Meadowlands Terminal and the farthest easterly point is at Jones Street and King Street. There are bus stops at intersections of Main Street / Dow Avenue and Main Street / Haddon Avenue. Bus Route 5 provides weekday service with 4-6 buses in the westbound and eastbound AM and PM peak periods. It also provides weekend (Saturday and Sunday) service.

Route 10 – B Line Express is an express route that travels from University Plaza in the west end to Eastgate Square in the east end. There are bus stops at intersections of Main Street / Emerson Street and Main Street / Longwood Road. Bus Route 10 provides weekday service with 7-8 buses in the westbound and eastbound AM and PM peak periods. It also provides Saturday service.

The HSR route maps and service schedules are provided in Appendix A.

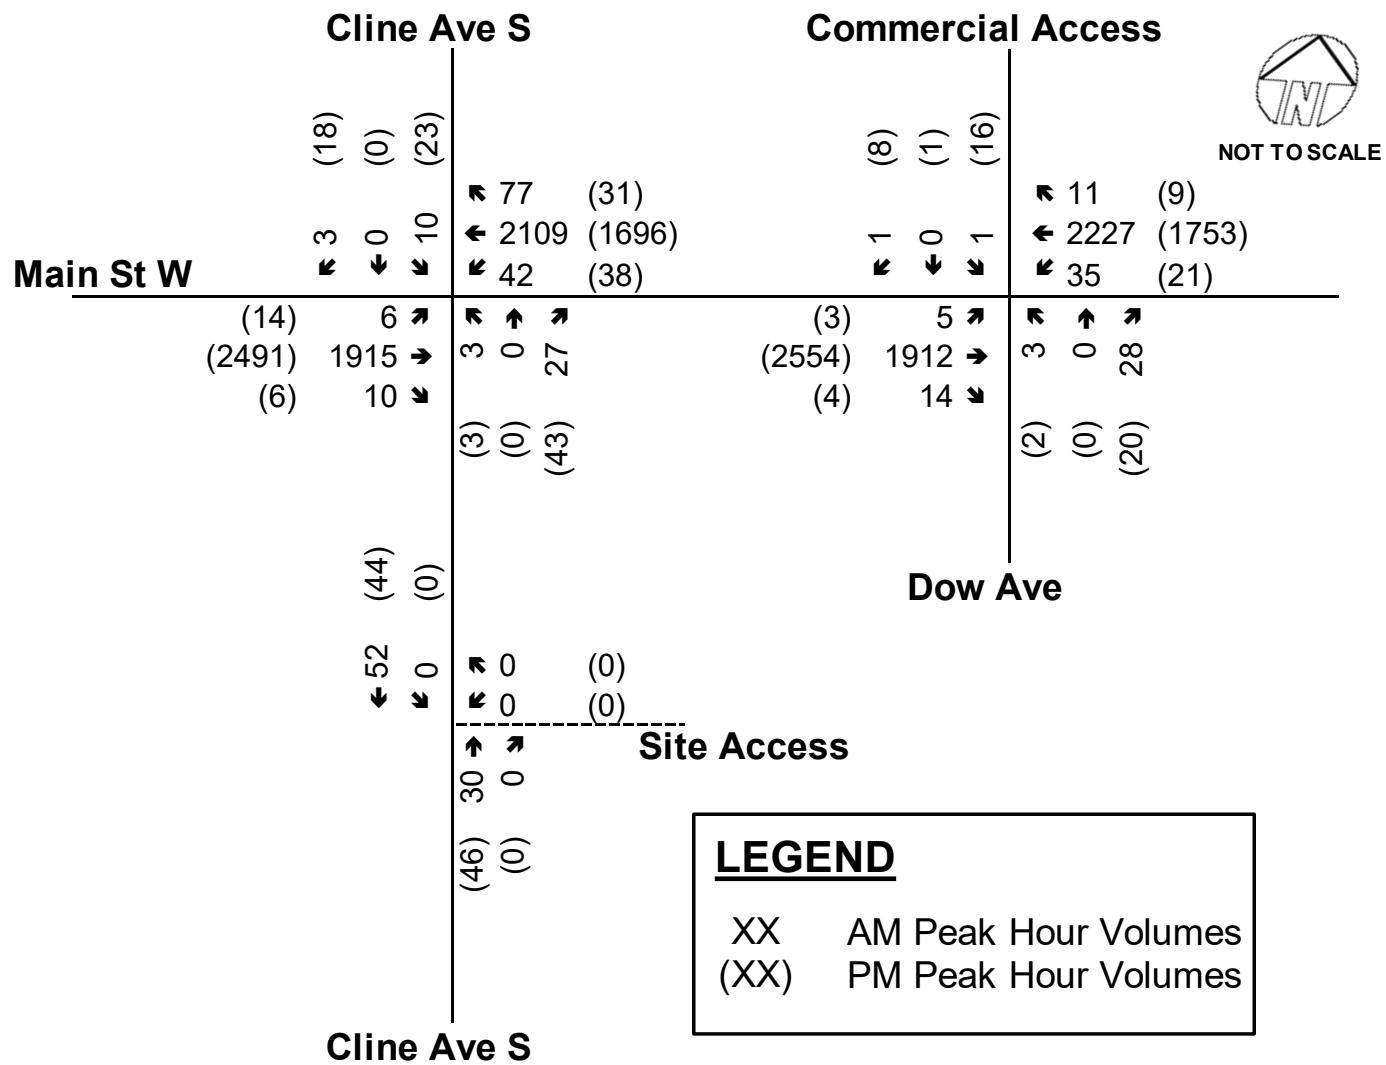

Figure 4 Existing traffic volumes

GO Transit

GO Transit provides rail service along the Lakeshore West line between Union Station in Toronto and the Hamilton GO Centre Station. Lakeshore West line provides weekday service with 4 trains in the morning peak periods in the direction of Hamilton to Toronto, and 4 trains in the afternoon peak periods in the direction of Toronto to Hamilton. GO Transit provides bus service along the Lakeshore West line between Union Station in Toronto and the Hamilton GO Centre Station with 30 minutes headway.

The subject site residents will have access the Hamilton GO Centre Station via HSR Bus Route 5.

The Lakeshore West rail schedule is provided in Appendix A.

3.4 Existing traffic conditions

The capacity analysis identifies how well the intersections and driveways are operating. The analyses are based on the methodology contained in the Highway Capacity Manual, which assigns an intersection Level of Service (LOS) based on the average control delay experienced by each vehicle passing through that intersection. Synchro software was utilized to conduct the analysis.

Peak hour factors for the study intersections were from the existing traffic data and used in the Synchro analysis.

For analysis purposes, 'critical' intersection movements are defined as traffic movements where:

- Volume to capacity (v/c) ratio of through movement or shared through/turning movement exceeds 0.85; or
- Volume to capacity (v/c) ratio of an exclusive turning movement exceeds 0.90.

Table 1 summarizes the results of the existing intersection capacity analyses. Appendix B contains the detailed existing intersection capacity analysis reports.

The existing traffic conditions are as follows:

- **Main Street & Cline Avenue**

Under existing conditions, the southbound left-through-right shared movement (minor approach) is operating at LOS 'F' (have longer than 'acceptable' delays) during the weekday AM and PM peak hour periods. This is primarily due to the high west / east traffic along Main Street. However, due to the low volume of the southbound shared movement, the v/c ratios during the weekday AM and PM peak hours are acceptable at 0.40 and 0.50, indicating that the southbound left-through-right shared movement is operating within 'design capacity' (i.e., with volume to capacity ratios much lower than 1.0).

During the weekday AM peak hour, the westbound through movement is identified as a critical movement with a v/c ratio of 0.87. The existing westbound AM peak hour volumes on Main Street are 2109 vehicles in two lanes. This westbound volume exceeds typical roadway theoretical planning capacities (generally in the range of 800 to 1,000 vehicles per hour per lane).

All other individual movements are operating at acceptable levels of service (LOS 'D,' or better) and v/c ratios of 0.68 or less. No queue issues are identified.

- **Main Street & Dow Avenue**

Under existing conditions, the southbound left-through-right shared movement (minor approach) is operating at LOS 'F' (have longer than 'acceptable' delays) during the weekday AM and PM peak hour periods. Similar to Main Street and Cline Avenue intersection, this is primarily due to the high west / east traffic along Main Street. Due to the low volume of the southbound shared movement, the v/c ratios during the weekday AM and PM peak hours are acceptable at 0.05 and 0.33, indicating that the southbound left-through-right shared movement is operating within 'design capacity' (i.e., with volume to capacity ratios much lower than 1.0).

During the weekday AM peak hour, the westbound through movement is identified as a critical movement with a v/c ratio of 0.92. The existing westbound peak volumes on Main Street are 2227 vehicles per hour in two lanes during the AM peak hour. This westbound volume exceeds typical roadway theoretical planning capacities (generally in the range of 800 to 1,000 vehicles per hour per lane).

All other individual movements are operating at acceptable levels of service (LOS 'E,' or better) and v/c ratios of 0.69 or less. No queue issues are identified.

Table 1 Existing traffic conditions

Intersection	Control Type	AM Peak Hour			PM Peak Hour		
		Overall v/c (LOS) Delay in Seconds	Critical/ Key Movements v/c(LOS) Delay in Seconds	95th %ile Queues (m)	Overall v/c (LOS) Delay in Seconds	Critical/ Key Movements v/c(LOS) Delay in Seconds	95th %ile Queues (m)

4. Background Traffic Conditions

4.1 Study horizon

Based on consultation with the applicant, the proposed development is expected to be completed in 2022. Therefore, the study horizon is 2027, five years beyond build-out.

4.2 Planned road network

Metrolinx has identified the development of the Main/King/Queenston B-Line LRT line in Hamilton linking McMaster University, Downtown and Eastgate Square as a top transit priority in the Regional Transportation Plan – The Big Move and the Province of Ontario has approved the Environmental Project Report (EPR) for the LRT project.

In the study area, Main Street West currently contains two westbound traffic lanes and three eastbound traffic lanes as well as a centre bi-directional left turning lane. Under the proposed LRT design, this section of Main Street West would still contain two westbound traffic lanes and three eastbound traffic lanes however no centre turning lane. The LRT guideway would be located between westbound and eastbound traffic lanes.

Crossings of the LRT guideway outside of signalized intersections will not be permitted. Eastbound traffic on Main Street West would be able to turn right onto Cline Avenue South or onto Dow Avenue. Vehicles exiting the subject lands in a northerly direction would be able to turn right onto eastbound Main Street. Westbound traffic accessing the subject lands must make a U-turn where permitted at signalized intersections west of the subject lands in order to turn around and access the subject lands in an eastbound direction at Cline Avenue. Similarly, vehicles leaving the subject lands in order to travel westbound on Main Street West will have to travel east on Main Street West until an approved U-turn location.

4.3 Future traffic / corridor growth

Based on a review of the available “City of Hamilton Rapid Transit Initiative Acoustic Assessment Report-Final” prepared by Dillon Consulting Limited, the Dillon’s study estimated the peak PM volumes for 2031 with LRT conditions along Main Street West within the study area, which applied an annual growth rates of 0.73% to Main Street West in the study area from 2008 to 2031 horizon (provided in Appendix C). To be conservative, this analysis applied annual growth rates of 1.0% to all movements to estimate the background traffic growth for the 2027 study horizon.

The net growth traffic volumes are shown in Figure 5.

Based on the above discussions, the existing traffic and the estimated net traffic growth were combined to estimate the future background weekday AM and PM peak hour traffic volumes. The background (2027) traffic volumes are presented in Figure 6.

As discussed in Section 4.2, crossings of the LRT guideway outside of signalized intersections will not be permitted. Therefore, the estimated future background traffic derived from the existing traffic was adjusted to account for the turn restricts and U-turns. With the implementation of the Main Street LRT Line, the diverted background (2027) traffic volumes are presented in Figure 7.

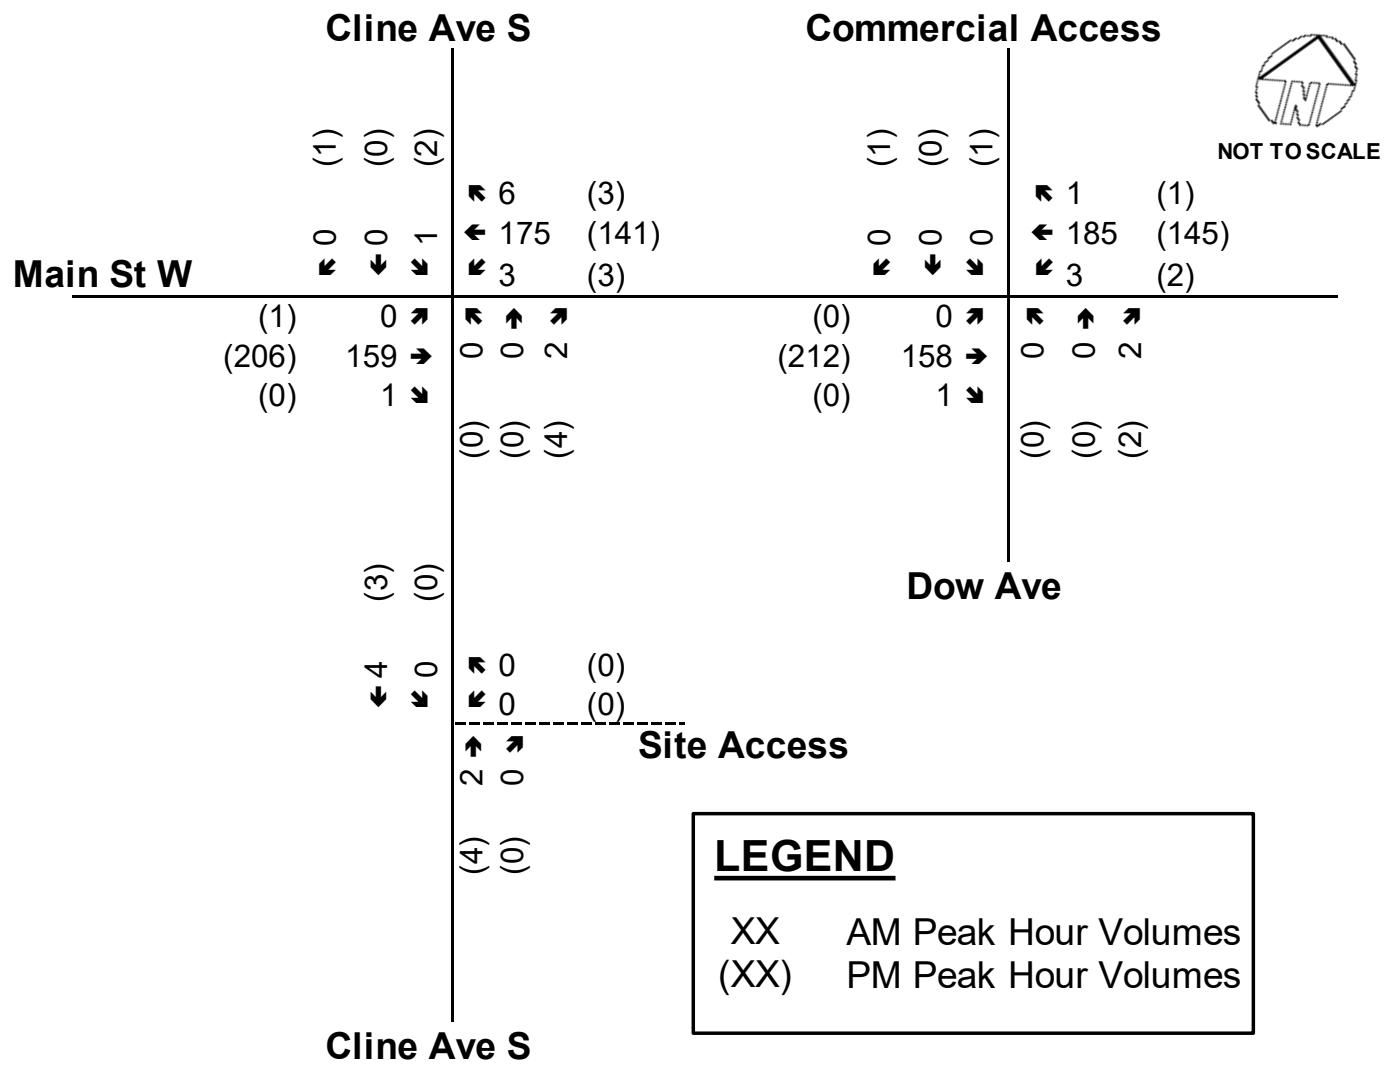

Figure 5 Net growth traffic volumes

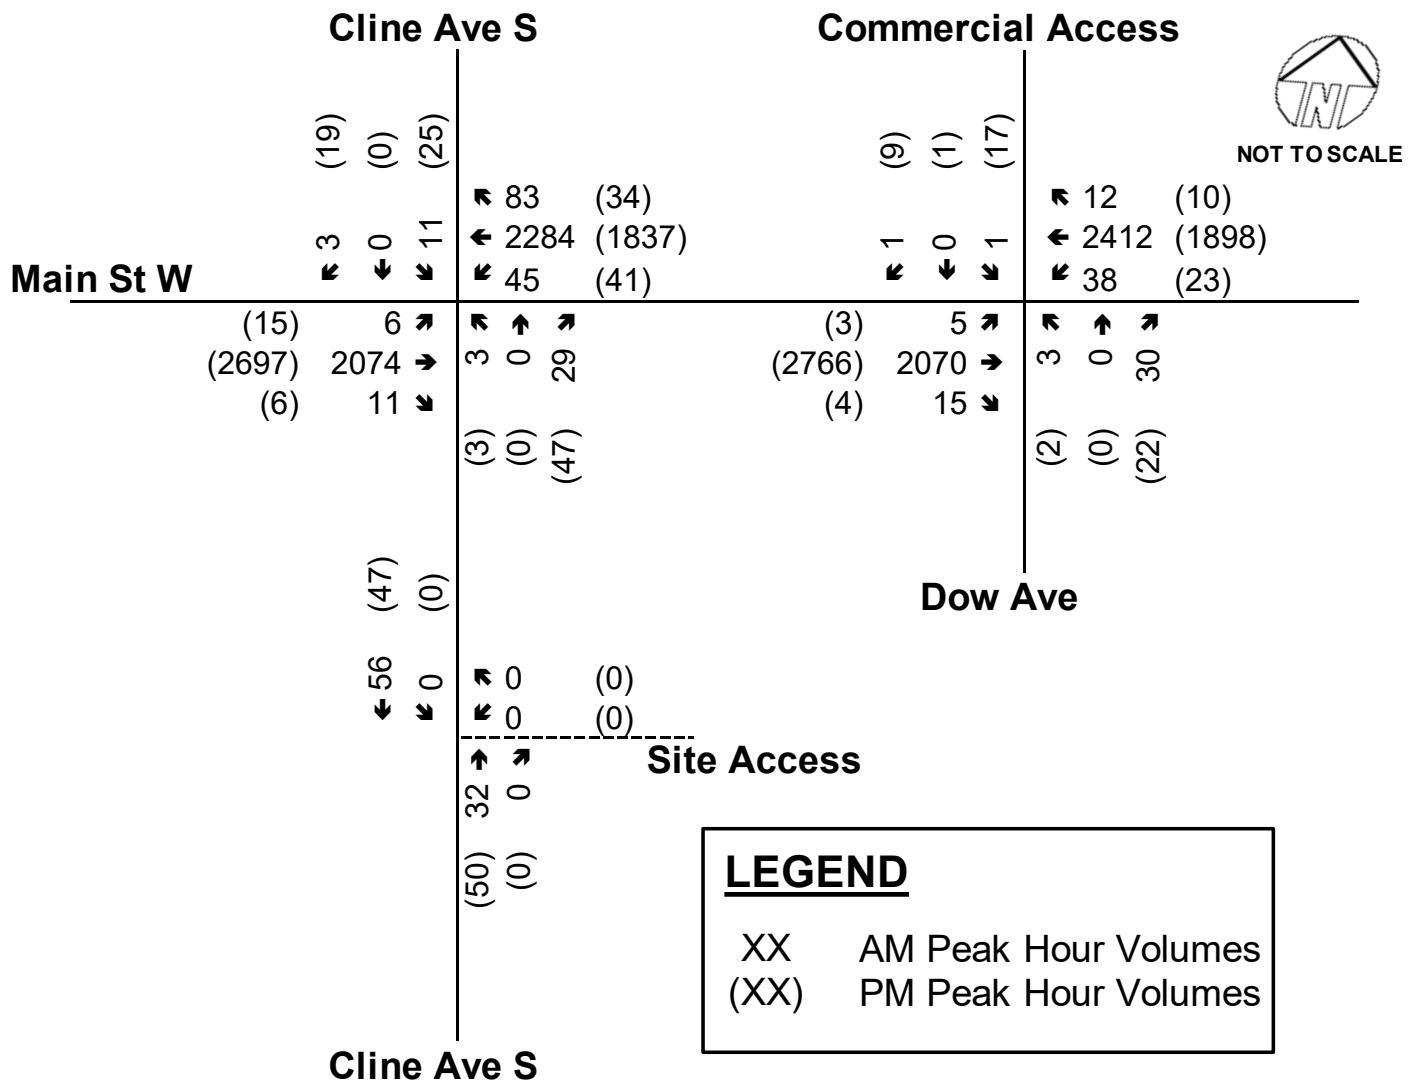

Figure 6 Background traffic volumes

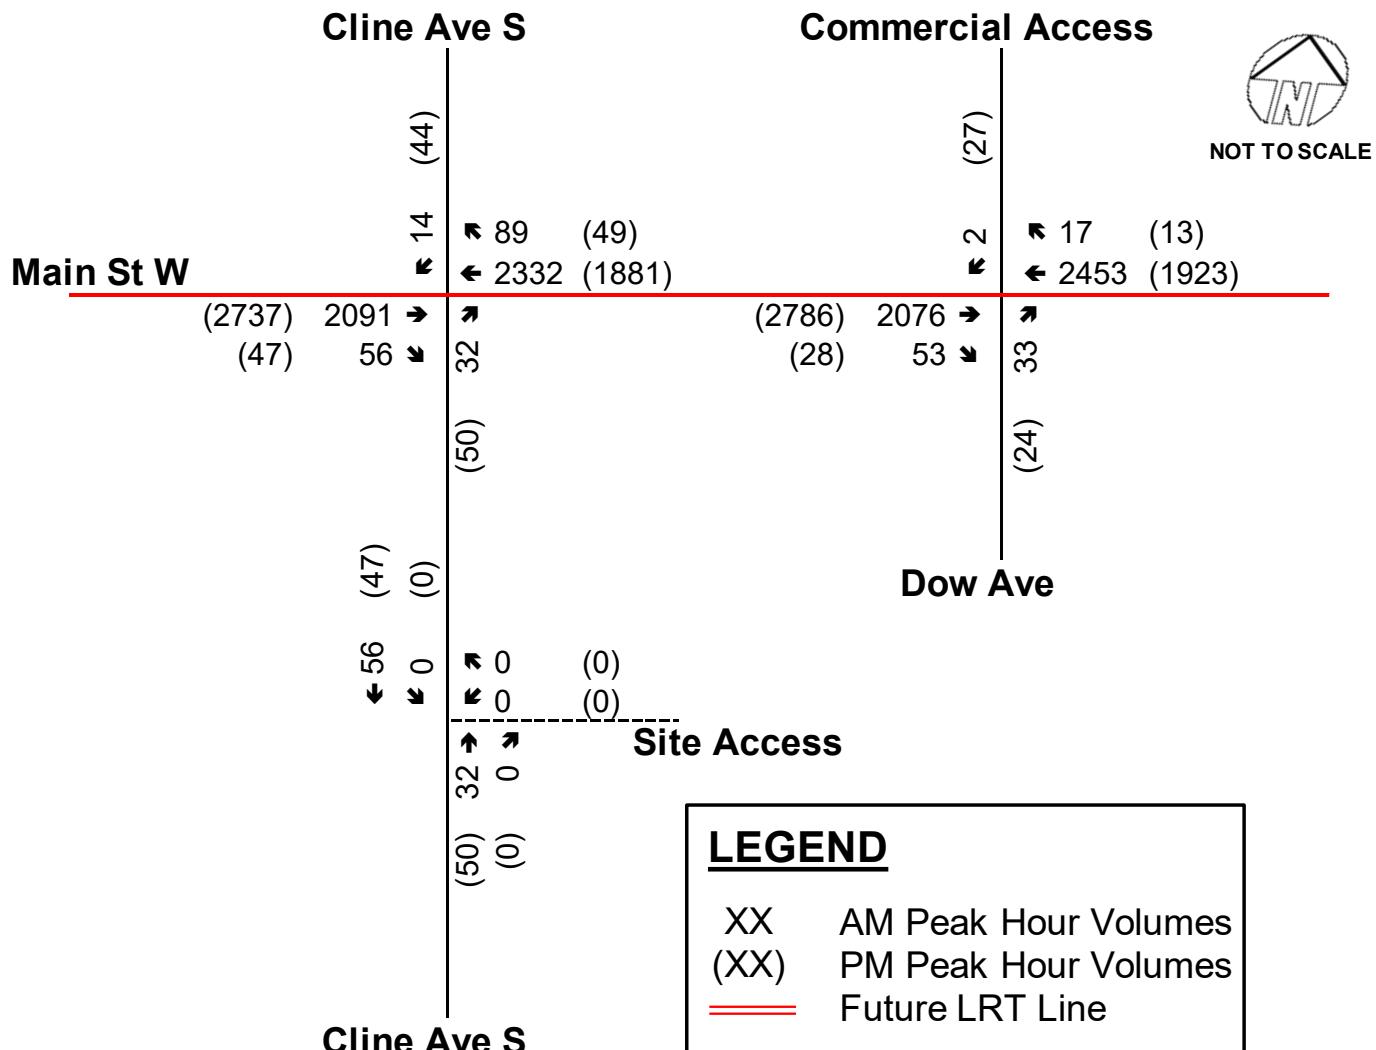

Figure 7 Background traffic volumes with LRT Line

4.4 Background traffic conditions with LRT Line

The future background (2027) traffic volumes with LRT Line were subjected to intersection capacity analyses based on the same methodologies utilized for the existing conditions. Peak hour factors for the study intersections were from the existing traffic data and used in the Synchro analysis.

Table 2 summarizes the results of the intersection capacity analysis. Appendix D contains the detailed background (2027) intersection capacity analysis reports.

The background traffic conditions are as follows:

- **Main Street & Cline Avenue**

Under background traffic conditions with LRT Line, the northbound and southbound left-through-right shared movements (minor approaches) are expected to operate at LOS 'D' or better with v/c ratio of 0.21 or less during the weekday AM and PM peak hour periods.

During the weekday AM peak hour, the westbound through movement is identified as a critical movement with a v/c ratio of 0.96. The estimated background westbound peak volumes on Main Street are 2332 vehicles per hour in two lanes during the AM peak hour. Same as Existing Conditions, this westbound volume exceeds typical roadway theoretical planning capacities (generally in the range of 800 to 1,000 vehicles per hour per lane).

All other individual movements are expected to operate at v/c ratios of 0.75 or less. No queue issues are identified.

Table 2 Background traffic conditions

- Main Street & Dow Avenue**

Under background traffic conditions with LRT Line, the northbound and southbound left-through-right shared movements (minor approaches) are expected to operate at LOS 'D' or better with v/c ratio of 0.12 or less during the weekday AM and PM peak hour periods.

During the weekday AM peak hour, the westbound through movement is identified as a critical movement with a v/c ratio of 1.01. The estimated background westbound peak volumes on Main Street are 2453 vehicles per hour in two lanes during the AM peak hour. Same as Existing Conditions, this westbound volume exceeds typical roadway theoretical planning capacities (generally in the range of 800 to 1,000 vehicles per hour per lane).

All other individual movements are expected to operate at v/c ratios of 0.76 or less. No queue issues are identified.

5. Proposed development

5.1 Site traffic generation

The proposed development, at full build-out, is expected to consist of 310 residential rental units with 5,760.3 ft² (535.1 m²) gross floor area (GFA) of commercial at grade. The detail residential unit breakdown in the site plan (dated January 2020) is provided in Appendix E.

For comparison purposes, subject site trips were estimated based on the average trip rates as well as based on trip rates derived from the fitted curve equations of High-Rise Multifamily House (LUC #222) provided in Trip Generation, 10th Edition, published by the Institute of Transportation Engineers (ITE). The resultant trip rates, entering and exiting proportions, and estimated total site trips are summarized in Table 3.

Table 3 Site trip generation

Site Development	Units	Parameter	Peak Hour Trip Generation					
			Weekday AM Peak			Weekday PM Peak		
			In	Out	Total	In	Out	Total
Residential (High-Rise Multifamily House)	310	Gross Rate (Average Rate)	0.07	0.24	0.31	0.22	0.14	0.36
		New Trips	23	73	96	68	44	112
	310	Gross Rate (Fitted curve equation)	0.077	0.246	0.323	0.224	0.144	0.368
		New Trips	24	76	100	70	44	114

According to Table 3, to be conservative, the subsequent analysis applied the higher trip rates (derived from the fitted curve equation) of High-Rise Multifamily House.

As a rental apartment building, the proposed commercial component provides services predominately to the residents / students, and therefore it is not expected to generate any vehicular trips.

Although there could be an allowance for transit and active transportation modes, vehicle trip reductions were not considered for this analysis. Accordingly, the total site trips are expected to be 100 two-way vehicle trips during the weekday AM peak hour total and 114 two-way vehicle trips during the weekday PM peak hour.

5.2 Directional distribution and assignment

With the implementation of the Main Street LRT Line, Cline Avenue South and Dow Avenue connecting Main Street will be right-in and right-out. Left turns will not be permitted (or possible) at these unsignalized intersections due to the LRT in the centre of Main Street. In addition, as a student rental building, the majority of the site trips will be to or from the university of McMaster during the weekday AM and PM peak hours.

To be conservative, the analysis assumed that all site traffic will access the site from Main Street and Cline Avenue. Furthermore, all traffic will come from or go to the west (MacMaster University). The site traffic volumes are illustrated in Figure 8.

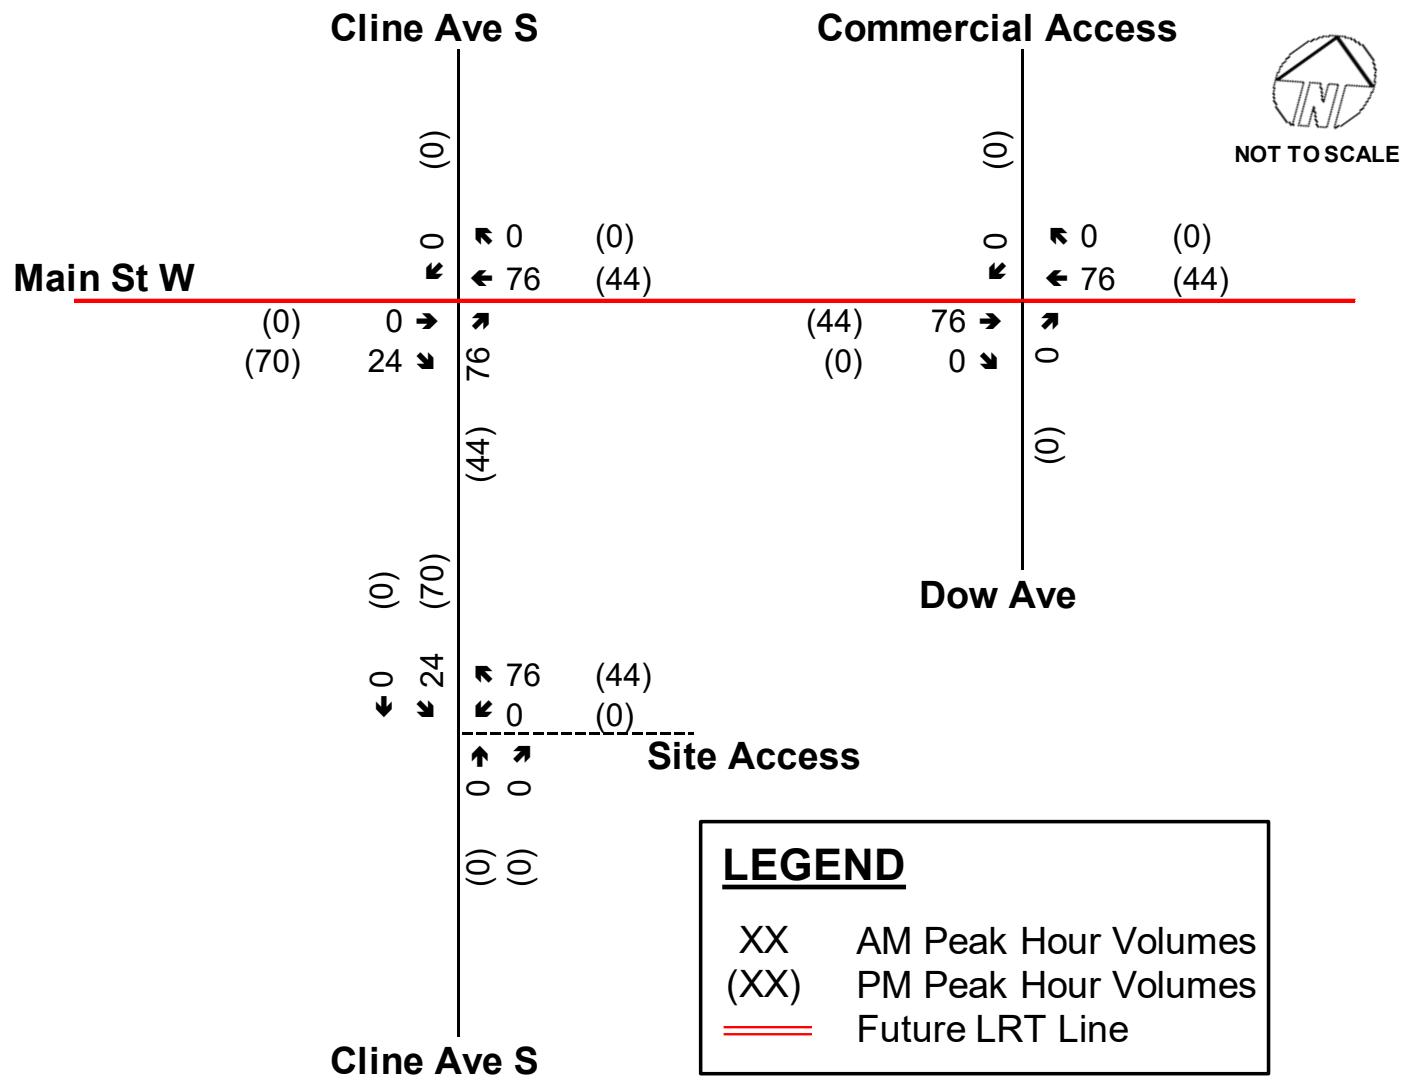

Figure 8 Site generated traffic volumes

6. Total traffic conditions

In order to estimate the traffic impacts due to the introduction of site related trips, the background traffic flows (Figure 7) were combined with the estimated site trips (Figure 8) to get the total traffic during the weekday AM and PM peak hours as illustrated in Figure 9.

The future total (2027) traffic volumes were subjected to intersection capacity analyses based on the same methodologies utilized for the background conditions. Peak hour factors for the study intersections were calculated based on the existing traffic data.

Figure 10 show the future lane configurations of the study area intersections including the proposed site accesses.

Table 4 summarizes the results of the intersection capacity analysis, while Appendix F contains the detailed total intersection capacity analysis reports.

Table 4 Total traffic conditions

Intersection	Control Type	AM Peak Hour			PM Peak Hour		
		Overall v/c (LOS) Delay in Seconds	Critical/Key Movements v/c(LOS) Delay in Seconds	95th % ile Queues (m)	Overall v/c (LOS) Delay in Seconds	Critical/Key Movements v/c(LOS) Delay in Seconds	95th % ile Queues (m)
Cline Ave S & Main St W	Unsignalized	SBR 0.10 (D) 33	EBT = 0.52 (A) 0 EBT = 0.52 (A) 0 EBTR = 0.31 (A) 0 WBT = 0.99 (A) 0 WBTR = 0.55 (A) 0 NBR = 0.35 (C) 22 SBR = 0.10 (D) 33	EBT = 0 m EBT = 0 m EBTR = 0 m WBT = 0 m WBTR = 0 m NBR = 15 m SBR = 5 m	NBR 0.41 (D) 31	EBT = 0.66 (A) 0 EBT = 0.66 (A) 0 EBTR = 0.40 (A) 0 WBT = 0.77 (A) 0 WBTR = 0.41 (A) 0 NBR = 0.41 (D) 31 SBR = 0.19 (C) 24	EBT = 0 m EBT = 0 m EBTR = 0 m WBT = 0 m WBTR = 0 m NBR = 15 m SBR = 5 m
Dow Ave/Commercial Access & Main St W	Unsignalized	SBR 0.02 (D) 34	EBT = 0.53 (A) 0 EBT = 0.53 (A) 0 EBTR = 0.30 (A) 0 WBT = 1.04 (A) 0 WBTR = 0.53 (A) 0 NBR = 0.11 (C) 17 SBR = 0.02 (D) 34	EBT = 0 m EBT = 0 m EBTR = 0 m WBT = 0 m WBTR = 0 m NBR = 5 m SBR = 5 m	SBR 0.12 (C) 23	EBT = 0.67 (A) 0 EBT = 0.67 (A) 0 EBTR = 0.35 (A) 0 WBT = 0.78 (A) 0 WBTR = 0.40 (A) 0 NBR = 0.10 (C) 22 SBR = 0.12 (C) 23	EBT = 0 m EBT = 0 m EBTR = 0 m WBT = 0 m WBTR = 0 m NBR = 5 m SBR = 5 m
Cline Ave S & Site Access	Unsignalized	WBLR 0.08 (A) 9	WBLR = 0.08 (A) 9 NBTR = 0.02 (A) 0 SBTL = 0.02 (A) 2	WBLR = 5 m NBTR = 0 m SBTL = 5 m	WBLR 0.05 (A) 9	WBLR = 0.05 (A) 9 NBTR = 0.03 (A) 0 SBTL = 0.05 (A) 5	WBLR = 5 m NBTR = 0 m SBTL = 5 m

The total traffic conditions are as follows:

- **Main Street & Cline Avenue**

Under total traffic conditions with LRT Line, the northbound and southbound right movements (minor approaches) are expected to operate at acceptable LOS 'D' or better with v/c ratio of 0.41 or less during the weekday AM and PM peak hour periods.

The westbound through movement is identified as a critical movement with a v/c ratio of 0.99 during the weekday AM peak hour. Compared to the future background condition, the westbound through v/c ratio increased by 0.03. The westbound peak volume on Main Street is estimated at 2408

vehicles per hour in two lanes. This westbound volume exceeds typical roadway theoretical planning capacities (generally in the range of 800 to 1,000 vehicles per hour per lane).

All other individual movements are expected to operate at acceptable v/c ratios of 0.77 or less. No queue issues are identified.

- **Main Street & Dow Avenue**

Under total traffic conditions with LRT Line, the northbound and southbound right shared movements (minor approaches) are expected to operate at acceptable LOS 'D' or better with v/c ratio of 0.12 or less during the weekday AM and PM peak hour periods.

During the weekday AM peak hour, similar to the Main Street and Cline Avenue intersection, the westbound through movement is identified as a critical movement with a v/c ratio of 1.04. Compared to the future background condition, the westbound through v/c ratio increased by 0.03. The westbound peak volume on Main Street is estimated at 2529 vehicles per hour in two lanes. This westbound volume exceeds typical roadway theoretical planning capacities (generally in the range of 800 to 1,000 vehicles per hour per lane).

All other individual movements are expected to operate at acceptable v/c ratios of 0.78 or less. No queue issues are identified.

- **Cline Avenue & Site Access**

Under total traffic conditions, this unsignalized access has excellent operational characteristics. All movements have 'good' LOS 'A'. No critical movements and queue issues are identified.

From a review of Table 4 above, the future background traffic plus the site traffic can be accommodated by the abutting street system with the Main Street LRT Line. Traffic generated by the proposed development does not add adverse impacts on the road network and no road improvements are triggered as a result of this development.

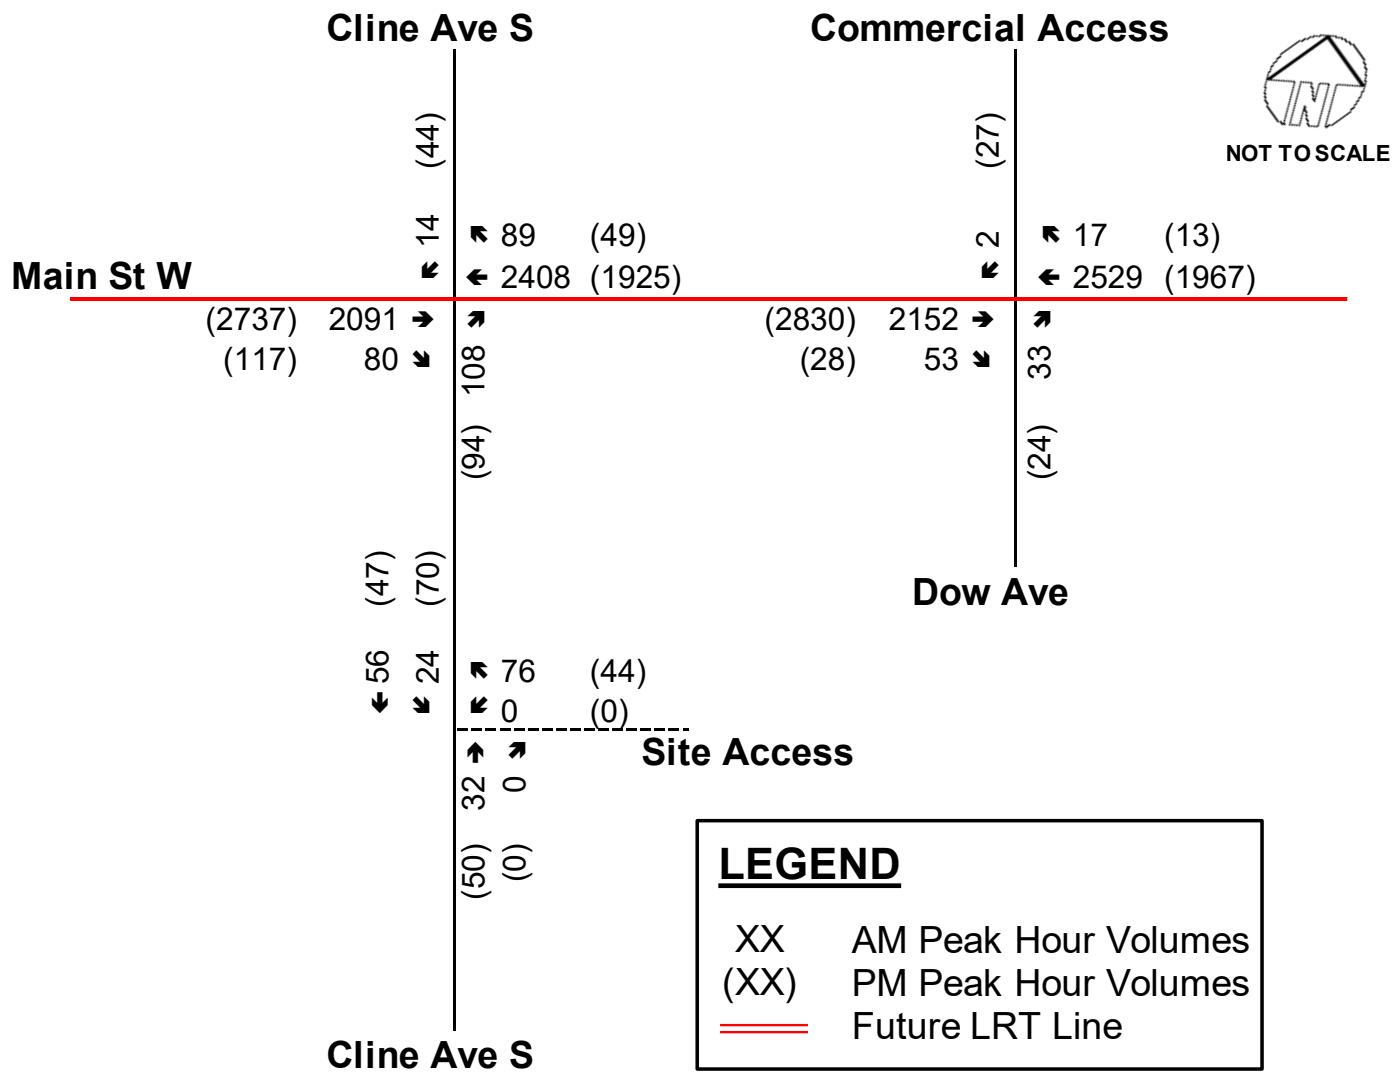

Figure 9 Total traffic volumes with LRT Line

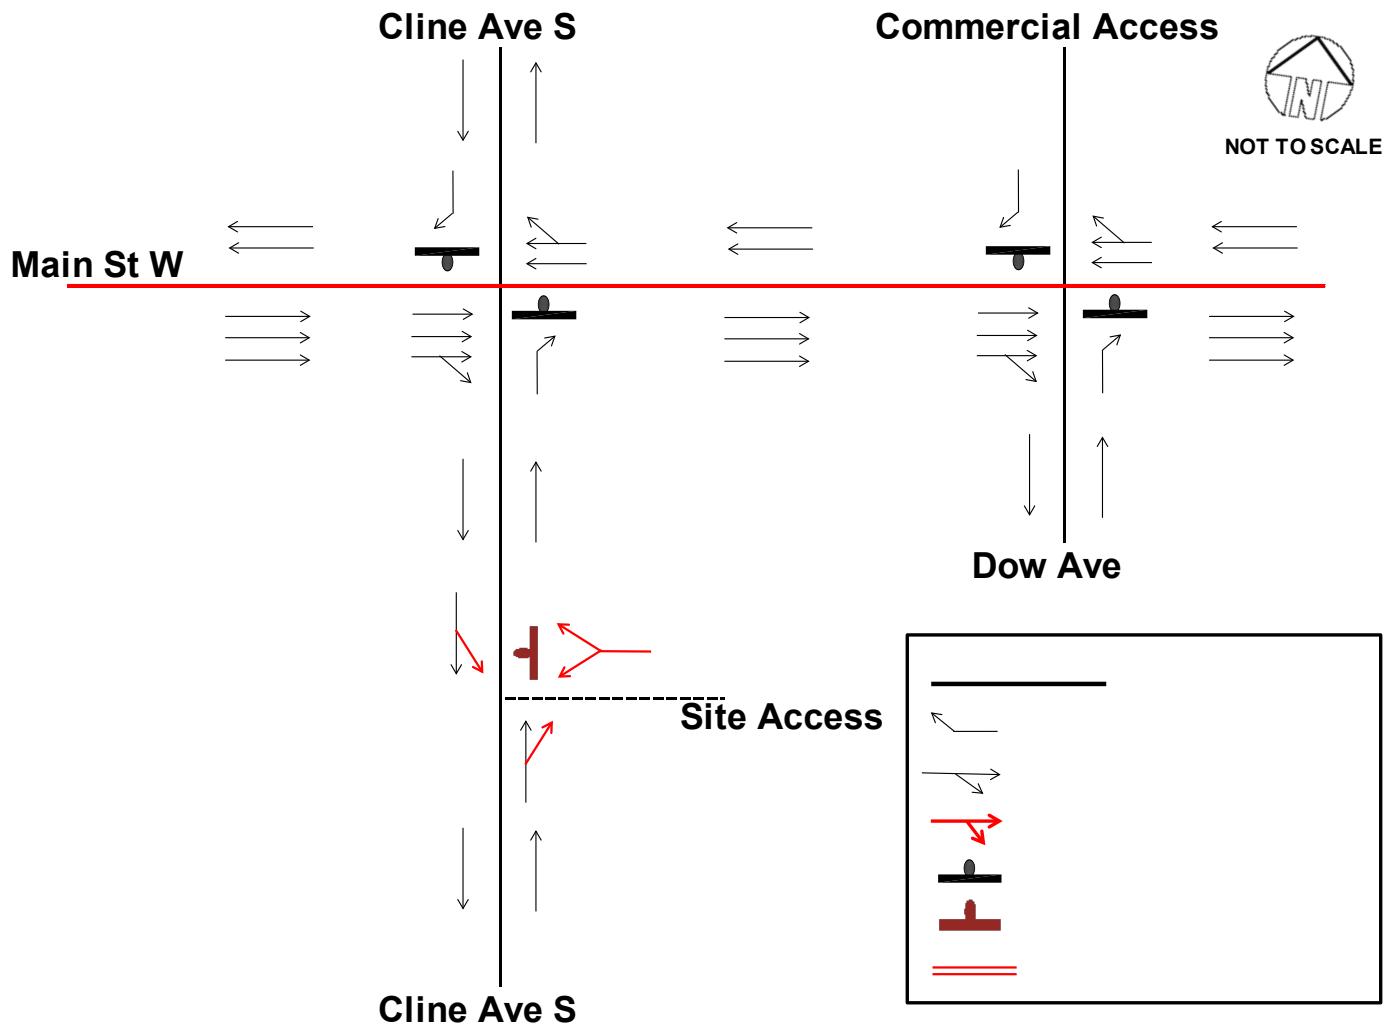

Figure 10 Future lane configurations and traffic controls

7. Parking supply

7.1 Review of City's parking by-law requirements

The proposed development consists of 310 residential rental units.

Based on our review of the City's current parking By-Law requirements (By-law # 05-200, Section 5.6, excerpts provided in Appendix G), for Multiple Dwelling residential use, the City By-Law requires 0.30 parking space per dwelling unit when dwelling units are less than 50.0 m², and 0.70 parking space per dwelling unit when dwelling units are greater than 50.0 m².

Based on the residential unit breakdown (total of 310 units) in the site plan (dated January 2020, provided in Appendix E), there are 92 units that are each less than 50.0 m² (538.20 ft²) in area, and 218 units that are each greater than 50.0 m² (538.20 ft²).

Table 5 summarizes the City's requirements for the site resident parking spaces.

Table 5 City's parking requirements for site residents

Units	City's By-Law Requirement	
	Parking Rate	Parking Spaces
	Resident	Resident
92 (< 50 m ²)	0.30	28
218 (> 50 m ²)	0.70	153
310 units		181

Therefore, the current By-Law requires 181 parking spaces for residents.

It should be noted that the current By-Law does not provide a visitor parking rate for the Multiple Dwelling residential use. For analysis purposes, we have used information from other jurisdictions. The City of Toronto By-law and existing parking demands for residential visitor parking requirements are reviewed and discussed in the next section.

7.2 Review of visitor parking requirement

City of Toronto visitor parking rate

Based on our review of the Toronto's current parking By-Law requirements (By-law # 569-2013, Section 200.5.10, excerpts provided in Appendix G), Toronto requires 0.10 visitor parking space per dwelling unit for Policy Areas 1 to 3 (downtown and transit corridor areas). The subject site is along the Main Street LRT Line, therefore the analysis will use the visitor rate of 0.10 for the proposed site visitor parking, and summarized in Table 8.

Review of existing parking demands

GHD conducted parking demand (or utilization) surveys to record the number of visitor vehicles at four residential buildings located within Durham Region during the expected peak period to establish the peak visitor parking demand. From our experience, the peak visitor period occurs on Saturday evenings. Therefore, to determine the maximum, we visited the locations every hour between 17:00 and 21:00 on two separate Saturdays to capture the peak visitor demand at each location and day. The peak visitor parking ratio was derived as 0.091 spaces per residential unit.

Selected parking sites

Given the available locations, the sizes were sufficiently large enough to obtain meaningful parking demand. Another criteria used to select the sites was the accessibility to the parking. That is the residential and visitor must be readily accessible and in these cases this means surface parking. Of the reviewed sites, all had surface visitor parking, however only one has surface resident parking. The other sites had underground resident parking. The selected sites are provided in Table 6.

Table 6 Surveyed site locations

Surveyed Site locations	Number of visitor parking spaces provided	Number of units
1525, 1535 Diefenbaker Court and 1530, 1540 Pickering Parkway, City of Pickering	60	273
1600 Charles Street, Town of Whitby	35	140
340 Watson Street West, Town of Whitby	71	215
4 Randall Drive, Town of Ajax	35	143

Parking data summary and analysis

In order to determine the existing peak visitor parking demand, we conducted a parking demand survey at four residential buildings located within Durham Region on Saturday February 6, 2016 and Saturday February 13, 2016 between 5pm and 9pm. We counted the number of occupied visitor parking spaces along with the supply during the survey period. The parking ratio was derived from the ratio of parked vehicles to the total number of units.

The survey results are summarized in Table 7. It is to be noted that the numbers provided in Table 7 are the maximum demand during the survey period for each location. Aggregated numbers based on the weighted average are also provided. The parking survey data of each location are provided in Appendix G.

Table 7 Surveyed visitor parking ratio

Location	Number of visitor parking spaces	Number of units	Maximum observed demand ratio Feb 6, 2016	Maximum observed demand ratio Feb 13, 2016
1525, 1535 Diefenbaker Court and 1530, 1540 Pickering Parkway, City of Pickering	60	273	0.059	0.062
1600 Charles Street, Town of Whitby	35	140	0.079	0.086
340 Watson Street West, Town of Whitby	71	215	0.116	0.112
4 Randall Drive, Town of Ajax	35	143	0.126	0.119
Weighted average			0.091	0.091

Based on the parking survey (Table 7), the weighted average visitor parking demand ratios was 0.091 parking spaces per unit for the two surveyed days.

Based on the City of Toronto By-law requirement and existing visitor parking survey data, the parking requirements for the site visitors is summarized in Table 8.

Table 8 Parking requirements for site visitors

Units	Toronto Requirement		Existing parking demand	
	Parking Rate	Parking Spaces	Parking Rate	Parking Spaces
	Visitor	Visitor	Visitor	Visitor
310	0.10	31	0.091	28

Therefore, the required visitor parking is 28 and 31 spaces, respectively, based on the existing parking demands and the Toronto's By-law for visitor parking.

7.3 Recommended parking ratio and spaces

Parking requirements for residents

For Multiple Dwelling residential use, the City of Hamilton's current parking By-Law requires 181 parking spaces for the site residents (see Table 5). It should be noted that the parking requirements for the student rental apartment building is expected to be less than the typical residential building.

Parking requirements for visitors

Based on the City of Toronto By-law requirement and existing visitor parking survey data, the required visitor parking is 28 and 31 spaces (see Table 8), respectively for the proposed development.

As a rental apartment building, the proposed commercial component provides services predominately to the students / residents, and therefore is no parking needed for the commercial use.

Therefore, the estimated total parking requirement for the proposed development will be 212 (181 resident +31 visitor) parking spaces.

From a review of above, the proposed parking supply of 234 spaces will meet Hamilton's By-law requirements for resident parking and can accommodate anticipated visitor parking demand.

8. Site circulation review

The site plan was reviewed with respect to design vehicle circulation using AutoTURN software.

Based on the analysis, the proposed site plan is sufficient to accommodate the circulation requirements of garbage trucks as well as medium single unit (MSU) trucks. By all indications in Appendix H, there are no truck circulation concerns with the site plan.

The proposed parking level plans are sufficient to accommodate circulation requirements of the passenger car design vehicles, as illustrated in Appendix H.

Therefore, the proposed site plan has been reviewed and found to be acceptable in terms of vehicular flow and parking space accessibility. Therefore, we conclude that the current site plan can accommodate the intended design vehicles.

9. Transportation demand management

Transportation Demand Management (TDM) is the term used to describe initiatives, policies and recommendations to reduce the public's dependence on the car and use alternate modes of transportation (transit, carpooling, and active transportation such as walking and cycling) which will contribute to the reduction of overall site congestion and parking requirements. The composition and location of the subject development is ideally suited for the application of TDM initiatives.

The distance between Cline Avenue and University Avenue (McMaster University) is approximately 700 m along Main Street West. There are LRT stations proposed at McMaster University and at Longwood Road (approximately 400 m east of the subject site, in the opposite direction of the University). Therefore, it is not likely that the LRT will be used by residents of the development to travel to/from the University. However, they can use existing transit stops and buses.

9.1 Background

The City of Hamilton completed a TDM Guide for Development in 2015, which contained information about ways to integrate TDM into new development, redevelopment and existing buildings, identified the needs and interests of employers, assessed TDM's market potential, and evaluated different ways of involving employers in initiatives of commuting options. The study indicated that the priority TDM measures for the City of Hamilton should be enhancing transit and ridesharing. It recommended a regional TDM program called Smart Commute Hamilton.

Smart Commute is a TDM approach designed specifically to influence the mode and time of travel in order to promote sustainability and a more efficient use of the transportation system. Established in 2007, Smart Commute Hamilton is one of 19 Smart Commutes across the Greater Toronto and Hamilton Area (GTHA) working to provide programs and services that help commuters make single occupant vehicle trip reductions for study, work and home life. Therefore, the City is valuable resources and partners to establish TDM initiatives in the study area.

9.2 TDM incentive policies / strategies

A number of incentive policies are potentially applicable to the subject site developments including:

- Trip reduction
- General information and education programs
- Individualized Marketing programs
- Provision of car share vehicles in accessible and visible parking locations
- Provision of secure bicycle parking for residents and visitors
- Developing active transportation connections and linkages and prioritize the implementation of the City's Active Transportation Network. Accommodations to increase access and convenience for pedestrians and cyclists. Provide education around increased opportunities for active transportation.

These are described below:

Trip reduction: The objective of TDM trip reduction strategies is to minimize the net increase in vehicular trip making associated with new development.

General Information programs: The General Information programs would involve working with sales and marketing staff to promote the advantages of living and working within the local communities, so as to attempt to attract people who are interested in a more sustainable lifestyle. It could include information and / or mapping related to transit routes, schedules and fares and the active transportation network.

Individualized Marketing programs: The preferred Individualized Marketing (IM) approach would encourage the new residents/students to consider and try travel options that respond to their individual needs through a variety of incentives, including potentially free transit passes for a limited (but habit forming) period.

Residents/students could be offered incentives to support a travel mode switch including free or discounted transit passes. Residents/students that are using sustainable modes of travel (e.g. transit, walk or bike) could also receive a reward (e.g. gift cards for local businesses / services) to support their continued sustainable travel behaviors.

Car Share Programs: Offering “car sharing” to new residents/students, would allow them to enjoy the accessibility benefits of car ownership for shopping, personal business and recreational travel without having to purchase the first or second car. To the extent that car sharing reduces or delays car ownership for new residents/students, it would offer substantial cost savings to new residents/students could reduce the number of parking spaces required (a cost saving to the developer/builder).

Secure Bike Parking: The provision of secure bike parking for residents and visitors will encourage cycling as an alternative to driving (or taking transit) or as a way to improve access to rapid transit for persons living beyond convenient walking distance of transit. Therefore, this should be a requirement and long term and short-term parking space standards should be increased. Furthermore, improved long and short term secure bike storage (indoor and outdoor as appropriate) should be mandated to improve the accessibility and storage/security environment.

9.3 Transportation demand measures for subject site

Based on the measures recommended in Hamilton TDM Guild for Development, the following Transportation Demand Measures have been identified and recommended for the subject site:

Cycling

- Provide visible, well-lit, short term bicycle parking on-site.
- Provide secure bicycle parking for residents and visitors.
- Provide connections between site to the City's bicycle network.

Walking

- Wherever possible, building main accesses should face the street, especially along arterial roads.
- Enhance pedestrian amenities on-site (benches, landscaping, lighting).

Transit

- Enhance walking routes between main building entrances and transit bus stops.
- Provide bicycle parking located at or near transit stops.
- Provide transit information on-site and adjacent to bus stops.

Parking

- Provide the minimum number of required parking spaces.
- Reduce minimum parking requirements based on proximity to transit
- Share parking with nearby developments or on-street
- Reduce minimum parking requirements based on provision of dedicated car share vehicle parking spaces

Car share / Bike share

- Develop community car-sharing programs
- Provide on-site car share vehicle
- Provide on-site bike share facility

Travel Planning

- Educate and inform new home buyers by providing informational package including transit maps, schedules and fares, bicycle route maps and other brochures;

Promotion

- Provide subsidized transit passes, car share memberships, and/or bike share memberships for new residents / students
- Provide sale of transit passes at site commercial / retail, provide residents with the convenience and incentive to utilize the available transit facilities.

9.4 Evaluation of transportation demand measures

With success of TDM programs in other jurisdictions, like City of Toronto and Region of York, the momentum will encourage participation by residents and employees of the subject site.

1. Transit measures will be in place means that modal choice options will be available at the future occupancy. The direct access to future public transit facilities will provide an instantaneous benefit to residents, employees and visitors to the area. As discussed in **Section 5.1**, although there could be an allowance for transit and active transportation modes, to be conservative vehicle trip reductions were not considered. The following is a conservative estimate of vehicle trip reductions given that the development is within walking distance of bus routes.
2. As mentioned, the Hamilton TMP (2007) indicates a transit mode split of 12% and an additional 15% for other modes (walk and cycle) for 2031, for a total of 27% non-auto mode.

The developer sponsored transit pass programs (pre-paid transit, such as Presto Card) and sale of transit passes at the site retail will influence and promote transit use among residents and visitors by providing these users with a convenient location to purchase transit fares. It is anticipated that these measures will increase transit usage to a potential 10% non-auto mode usage.

3. The provision of cycling or walking measures (cycle paths/lanes and sidewalks) will help to promote active modes of transportation. These measures will encourage more users to walk or

cycle instead of driving automobiles. It is anticipated that these facilities will increase 2% in cycling and walking usage.

4. Carpool networks (such as Smart Commute Hamilton) can be established for residents / students. Users owning vehicles that intend to drive within the study area can be matched with other users destined to the same location or within the area. Social media websites can be used to match commuters and shared trips. Also, employers could maintain a database of drivers and their destinations in order to match potential participants. Alternatively, carpool groups could be formed among employees and among residents by posting/advertising in common areas such as lobbies or staff rooms. For example, if 10 drivers form carpools of 2 persons, then there is 5 less drivers or vehicle trips on the road.

Table 9 summarizes the anticipated further reduction in vehicle trips based on the adoption of the measures discussed above.

The possibilities are there through transit ridership, cycling, and carpooling to reduce auto-dependency since all or a combination of these Transportation Demand Management (TDM) practices can be implemented. With the implementation of the suggested TDM measures, the overall subject site generated trips could be further reduced by approximately 17 trips (15% to 17%).

Table 9 TDM trip reduction

Transportation Demand Measure	Potential Peak Hour Trip Reduction	
	Weekday AM	Weekday PM
Base Case Trip Generation (New Trips)	100	114
Increased Transit Usage (10%)	-10	-11
Provision of Cycling Facilities (2%)	-2	-2
Carpooling	-5	-5
Total Reduction	-17 (-17.0%)	-17 (-14.9%)
Reduced New Trips	83	97

The TDM program should be monitored to determine its effectiveness at achieving the overall objectives of the transportation system, as well as the effectiveness of each individual TDM measures.

10. Findings, conclusions and recommendations

- 1) The purpose of this report is to determine the traffic-related impacts on the roadway system from the proposed mixed-use residential development located at 1107 Main Street West, generally south of Main Street West and between Cline Avenue South and Dow Avenue in the City of Hamilton. It is also to determine the appropriate Transportation Demand Management measures and to demonstrate that the subject site has adequate pedestrian, transit and cycling linkages to existing/proposed infrastructure.
- 2) The proposed development, at full build-out, is expected to consist of 310 residential rental units with 5,760.3 ft² (535.1 m²) gross floor area (GFA) of commercial at grade. There are 234 parking spaces provided consisting of 226 parking stalls on 3 levels of underground parking and 8 on-street spaces. Vehicular access will be provided by two full-move driveways: one on Cline Avenue for resident and visitor vehicles, and the other on Dow Avenue for loading and garbage trucks.
- 3) The study intersections for capacity analysis are:
 - Main Street West at Cline Avenue South;
 - Main Street West at Dow Avenue; and
 - Cline Avenue South at Site Access.
- 4) Recent weekday turning movement counts were conducted by Ontario Traffic Inc. on September 17, 2019 at the existing study intersections of Main Street West / Cline Avenue South and Main Street West / Dow Avenue.
- 5) For study purposes, the proposed development is expected to be completed in 2022. Therefore, the study horizon is 2027, five years beyond build-out.
- 6) The proposed development is adjacent to the Main/King/Queenston B-Line LRT corridor. Metrolinx has identified the development of this LRT line in Hamilton linking McMaster University, Downtown and Eastgate Square as a top transit priority in the Regional Transportation Plan – The Big Move and the Province of Ontario has approved the Environmental Project Report (EPR) for the LRT project.
- 7) Based on a review of the available "City of Hamilton Rapid Transit Initiative Acoustic Assessment Report-Final" prepared by Dillon Consulting Limited, the Dillon's study estimated the PM peak hour volumes for year 2031 with LRT conditions along Main Street West within the study area, which assumed an applied annual growth rates of 0.73% from 2008 to the 2031 horizon. To be conservative, this analysis applied an annual growth rate of 1.0% to all movements to estimate the background traffic growth for the 2027 study horizon.
- 8) Subject site vehicular trips were estimated based on the average trip rates as well as based on trip rates derived from the fitted curve equations of High-Rise Multifamily House (LUC #222) provided by Trip Generation, 10th Edition, published by the Institute of Transportation Engineers (ITE). The resultant trip rates, entering and exiting proportions, and estimated total site trips are summarized in the table below:

Site Development	Units	Parameter	Peak Hour Trip Generation					
			Weekday AM Peak			Weekday PM Peak		
			In	Out	Total	In	Out	Total
Residential (High-Rise Multifamily House)	310	Gross Rate (Average Rate)	0.07	0.24	0.31	0.22	0.14	0.36
		New Trips	23	73	96	68	44	112
	310	Gross Rate (Fitted curve equation)	0.077	0.246	0.323	0.224	0.144	0.368
		New Trips	24	76	100	70	44	114

To be conservative, this analysis applied the higher trips (derived from the fitted curve equation) of the High-Rise Multifamily House.

As a residential rental apartment building, the proposed commercial component provides services predominately to the local residents / students, and therefore it is not expected to generate any vehicular trips.

Although there could be an allowance for transit and active transportation modes, trip reductions were not considered in this analysis to be conservative. Accordingly, the total new site trips are expected to be 100 two way trips during the weekday AM peak hour and 114 two way trips during the weekday PM peak hour.

- 9) The study concludes that the proposed development can be accommodated by the abutting street system with the future LRT Line. Traffic generated by the proposed development does not add adverse impacts on the nearby road network and no road improvements are triggered as a result of this development.
- 10) The City of Hamilton's current parking By-Law requires 181 parking spaces for the residents of the development. The City does not provide a requirement for visitor parking.

For visitor parking requirements, according to the parking surveys in Durham Region, the visitor parking demand is 0.091 per residential unit. Similarly, for example, in the City of Toronto, By-Law # 569-2013 requires 0.10 visitor parking space per dwelling unit for an apartment building. Therefore, the expected required number of visitor parking spaces is in the range of 28 and 31 for the proposed development assuming these rates.

The estimated total parking requirement for the proposed development will be 212 (181 resident +31 visitor) parking spaces.

- 11) Therefore, the proposed parking supply of 234 spaces will meet Hamilton's By-law requirements for resident p and can accommodate the visitor parking demand with an estimated surplus of 22 parking spaces. The Circulation Review confirms that the proposed site plan is sufficient to accommodate the circulation requirements of garbage trucks as well as medium single unit trucks. The proposed parking level plans are sufficient to accommodate circulation requirements of the passenger car design vehicles illustrated in (Appendix H).
- 12) Hamilton Street Railway (HSR) Transit currently provides bus service along Main Street West in the study area with Routes 5 and 10. Route 5 (Delaware) stops at the intersections of Main Street / Dow Avenue and Main Street / Haddon Avenue. Route 10 (B Line Express) stops at the intersections of Main Street / Emerson Street and Main Street / Longwood Road.

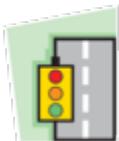

- 13) The site's residents can easily access to the surrounding pedestrian network and transit system along Main Street West via sidewalks on Cline Avenue and Dow Avenue.
- 14) It is possible that through transit ridership, cycling, and carpooling to reduce auto-dependency since all or a combination of these Transportation Demand Management (TDM) practices can be implemented. With the implementation of the suggested TDM measures, the overall subject site generated trips could be reduced by approximately 17 trips (15% to 17%).

HSR TRANSIT INFORMATION

10 B Line Interlining with 55-Stoney Creek Central or 58-Stoney Creek Local

For some trips, when the 10 B Line arrives at Eastgate Square, it may continue into Stoney Creek as a route 55 or 58 bus. The timetable inside indicates which trips do this. If you are continuing your trip into Stoney Creek, and it is the route you need, just stay on the bus. The same thing happens in reverse where some Stoney Creek buses will continue as a 10 B Line once it arrives at Eastgate Square. When these routes are not interlined, please refer to the 55 Stoney Creek Central and 58 Stoney Creek Local timetables.

Christmas Service

During the period between Christmas Day and New Year's Day, the HSR usually operates on a modified schedule on selected days. Some routes do not operate at all. Check with our Information Clerks at 905.527.4441 or our website www.hamilton.ca/hsr for details at that time.

The HSR does not take responsibility for errors in this document, for damages or inconveniences caused by delayed schedules or failures to make connections.

Trans-Cab Service

If you're coming from (or heading to) the area north of the QEW or the area east of Jones Road in lower Stoney Creek, give Stoney Creek Trans-Cab a try. This service operates Monday through Saturday as an extension of HSR bus routes 2, 10, 55 and 55A.

When travelling from the Trans-Cab service area first dial our contractor, 905.777.7777, and request a Trans-Cab pickup. They'll send a cab and drive you, and other customers, to the closest applicable TransCab transfer point. There is an additional fee for this service. Call HSR Information for details regarding the fare.

When heading to the Trans-Cab service area, just let the HSR Operator know that you require Trans-Cab service when boarding your bus. A cab will meet your bus at the applicable Trans-Cab transfer point and drive you the rest of the way.

GO Train and Bus Schedule/
Horaire des trains et des autobus GO

LW 18

Daily / Quotidiennement

Includes GO Bus route 18 /
Inclut le trajet 18 d'autobus GO

Effective / À partir de:

31 AUGUST/AOÛT 2019

How to read our schedules

Step 1

Find the station or terminal you are departing from. Stops are listed across the top in the order they are served.

Step 2

The upper left corner tells you what day the schedule is for and the direction of travel.

Step 3

Look across the rows for available departure times.

Step 4

Not all trains or buses stop at every station. If you see → the train or bus will not stop at that station.

Legend

Train trips

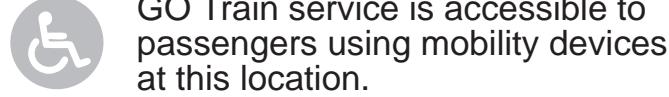

Bus trips

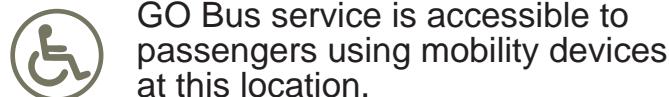

→ Trip does not serve this location.

↓ Check below for connecting trips.

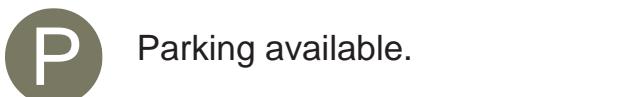

GO Train service is accessible to passengers using mobility devices at this location.

GO Bus service is accessible to passengers using mobility devices at this location.

GO Train & GO Bus service is accessible to passengers using mobility devices at this location.

P Parking available.

Notes

Fri Trip operates on Fridays ONLY. If Friday is a holiday, the trip operates on the Thursday before the holiday.

Sat Trip Operates on Saturdays ONLY.

Sun Trip Operates on Sundays ONLY.

D Stops to let off passengers on request only.

h Trip holds for connection from bus.

Bicycles

1. Bicycles are not allowed in Union Station or on-board trains during morning rush hour (6:30-9:30) and evening rush hour (15:30-18:30), Monday to Friday.

2. Foldable bicycles are allowed on-board trains at all times.

For the latest schedule information and updates, please visit gotransit.com/schedules.

Comment lire nos horaires

Étape 1

Trouvez votre gare ou terminus de départ. La liste des arrêts est donnée en haut dans l'ordre dans lequel ils sont desservis.

Étape 2

Le coin supérieur gauche vous indique le jour pour lequel l'horaire est donné et la direction de circulation.

Étape 3

Regardez dans les rangées pour obtenir les heures de départ offertes.

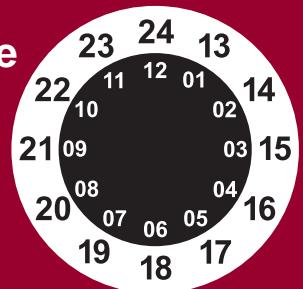

Étape 4

Les trains ou les autobus ne s'arrêtent pas tous à chaque gare. Si vous voyez le symbole → le train ou l'autobus ne s'arrêtera pas à cette gare.

Indications selon un système horaire de 24 heures

De minuit à midi:
00 01 - 12 00

De midi à minuit:
12 01 - 24 00

Notes

M-Th Service offert du lundi au jeudi.

Fri Service offert les vendredis SEULEMENT ou les jeudis précédant un vendredi férié.

Sat Service offert les samedis SEULEMENT.

Sun Service offert les dimanche SEULEMENT.

D Arrêt sur demande seulement.

h Attentes des trajets pour les connexions d'autobus.

Vélos

1. Les vélos ne sont pas autorisés dans la gare Union ou à bord des trains du lundi au vendredi, pendant l'heure de pointe (6:30-9:30) et pendant l'heure de pointe du soir (15:30-18:30).

2. Les vélos pliables sont permis à bord des trains en tout temps.

Pour consulter les horaires les plus récents et les mises à jour, veuillez visiter gotransit.com/schedules.

Excerpts of City's Rapid Transit Initiative Acoustic Assessment & traffic growth review

**City of Hamilton Rapid Transit
Initiative Acoustic Assessment
Report - FINAL**

March 2009

City of Hamilton
08-1310

Submitted by
Dillon Consulting Limited

2.1 Current (2008) Condition

This scenario consists of the current road configuration and current traffic conditions. Existing peak PM traffic volumes for the primary road segments along Main St. and King St. of the study area were provided in Exhibits 1 and 2 in Appendix B of the Rapid Transit Feasibility Study. This data is presented in Table 1.

The percentage of truck traffic was based on traffic volume and class data recorded by the City of Hamilton (the City) at King St. west of Wellington St. N and Main St. west of Wellington St. N. The respective percentages were assumed to be consistent on all road segments of Main St. and King St. that are under study. The percentage truck traffic on Main St. and King St. were estimated to be 3.0% and 2.2%, respectively. Traffic speed was assumed to be 50 km/h along subject routes (except west of Dundurn St. for which a flow speed of 60 km/h was used, based on information provided by the City).

Table 1 – Current 2008 Peak PM Peak Traffic Volumes

2.3 Future 2031 Mature State of Development – with-LRT Option 1

The with-LRT Option 1 consists of the LRT and vehicular traffic travelling in both directions on Main Street west of Paradise Road South. Between Paradise Road South and the intersection of Main and King Streets, the LRT and traffic travels east only on Main Street and west only on King Street. East of the Main and King intersection the LRT and traffic again travels in both directions along Main St.

The 2031 traffic volumes with the LRT were determined by applying a compounded annual growth rate of 2% to the 2008 1-hour PM peak traffic volumes, followed by a 25% reduction in non-commercial vehicular traffic and replacement of express buses along subject routes with the LRT. The PM peak traffic volumes for the roadway segments modelled is presented Table 3, below. As a result of the reduced volume in non-commercial traffic volumes, the percentage truck traffic on Main St. and King St. were estimated to be 5.6% and 3.5%, respectively.

The current 2008 city bus transit volumes were also assumed to remain the same in 2031 for both the no-build and with-LRT cases. For the future with-LRT scenarios, the express buses along the subject routes were assumed to be replaced by the proposed LRT. Traffic speed was assumed to be 50 km/h along subject routes (except west of Dundurn St. for which a flow speed of 60 km/h was used, based on information provided by the City). The LRT was assumed to be 26 m in length with a travel speed of 50 km/h. The peak frequency of 12 LRTs per hour on each route was assumed for modelling purposes. For Option 1 the number of traffic lanes on both Main St. and King St. was reduced by one.

Table 3 – Peak PM Volumes for 2031 with-LRT Option 1 Condition

Road Segment	PM Peak (veh/ hr)	
	EB	WB
Main Street (West to East)		
West of Cootes/ Leland	1183	1774
Cootes/ Leland to McMaster Entrance/ Emerson	2011	2720
McMaster Entrance/ Emerson to Haddon/ Bowman	1774	2247
Haddon/ Bowman to 403	2602	2011
403 to Longwood	2129	1774
Longwood to Dundurn	3311	-
Dundurn to Locke	3430	-
Locke to Queen	3311	-
Queen to Bay	2838	-
Bay to James	3548	-

system in place and two-way traffic on all sections of Main and King Streets. The methodology described above in Section 2.3 was used in predicting the 2031 traffic volumes with the LRT.

To account for the proposed two-way traffic on Main and King streets, traffic volumes for the one-way road segments between Paradise Road South to the King Street and Main Street intersection described above in Option 1, were halved and assigned to the eastbound and westbound traffic. The peak PM traffic volumes for the roadway segments modelled can be found in Table 4. As a result of the reduced volume in non-commercial traffic volumes, the percentage truck traffic on Main St. and King St. were estimated to be 5.6% and 3.5%, respectively.

The current 2008 city bus transit volumes were also assumed to remain the same in 2031 for both the no-build and with-LRT cases. For the future with-LRT scenarios, the express buses along the subject routes were assumed to be replaced by the proposed LRT. Traffic speed was assumed to be 50 km/h along subject routes (except west of Dundurn St. for which a flow speed of 60 km/h was used, based on information provided by the City). The LRT was assumed to be 26 m in length with a speed of 50 km/h. The peak frequency of 12 LRTs per hour on each east-bound and west-bound route was assumed for modelling purposes. For Option 2 the number of traffic lanes on King St. was reduced by two.

Table 4 – Peak PM Volumes for 2031 with-LRT Option 2 Condition

Road Segment	PM Peak (veh/ hr)	
	EB	WB

SITE DATA		
1107 MAIN STREET WEST, HAMILTON, ONTARIO		
DATA	REQUIRED	PROVIDED
ZONING	ZONING - TOC-1	
LOT AREA - PRE ROAD WIDENING	XX (m ²)	5,169.3 m ²
LOT AREA - POST ROAD WIDENING	XX (m ²)	4,517.0 m ²
FRONT YARD (meters)	4.5 (m)	1.6 m
EXTERIOR SIDE YARD (m)	6 (m) CLINE AVE S.	5.4 m
EXTERIOR SIDE YARD (m)	6 (m) DOW AVE	5.3 m
REAR YARD (m)	7.5 (m)	1.7 m

GENERAL NOTES

1. DO NOT SCALE DRAWINGS. WRITTEN DIMENSIONS SHALL HAVE PRIORITY OVER SCALED DIMENSIONS.

2. ALL WORK SHALL COMPLY WITH THE 2012 ONTARIO BUILDING CODE AND AMENDMENTS.

3. CONTRACTORS MUST CHECK AND VERIFY ALL DIMENSIONS AND SPECIFICATIONS AND REPORT ANY DISCREPANCIES TO THE ARCHITECT BEFORE PROCEEDING WITH THE WORK.

4. ALL CONTRACTORS AND SUB-CONTRACTORS SHALL HAVE A SET OF APPROVED CONSTRUCTION DOCUMENTS ON SITE AT ALL TIMES.

5. ALL DOCUMENTS REMAIN THE PROPERTY OF THE ARCHITECT. UNAUTHORIZED USE, MODIFICATION, AND/OR REPRODUCTION OF THESE DOCUMENTS IS PROHIBITED WITHOUT WRITTEN PERMISSION. THE CONTRACT DOCUMENTS WERE DRAWN UP BY THE CONSULTANT FOR THE BENEFIT OF THE OWNER.

6. THE MATERIAL CONTAINED HEREIN REFLECTS THE CONTRACTOR'S BEST JUDGEMENT IN LIGHT OF THE INFORMATION AVAILABLE TO HIM AT THE TIME OF PREPARATION. ANY USE WHICH A THIRD PARTY MAKES OF THE CONTRACT DOCUMENTS, OR ANY RELIANCE ON OR DECISIONS TO BE MADE BASED ON THEM ARE THE RESPONSIBILITY OF SUCH THIRD PARTIES.

7. THE CONSULTANT ACCEPTS NO RESPONSIBILITY FOR DAMAGES, IF ANY, SUFFERED BY ANY THIRD PARTY AS A RESULT OF DECISIONS MADE OR ACTIONS BASED ON THE CONTRACT DOCUMENTS.

BUILDING DATA

City's Parking By-Law requirements and parking survey summary

SECTION 5: PARKING

1000 or more spaces	Minimum 11 + 1% of the total number of required parking spaces.
---------------------	---

- b) Subsection 5.5 a) shall not apply to Single Detached Dwellings, Semi-Detached Dwellings, Duplex Dwellings and Street Townhouses abutting a public street.
- c) Where the application of the parking standards in Section a) above results in a numeric fraction, fractions shall be rounded down to the nearest whole number.

(By-law No. 06-324, October 25, 2006)

(By-law No. 16-265, October 12, 2016)

(By-law No. 18-219, August 17, 2018)

(By-law No. 19-062, March 27, 2019)

5.6 PARKING SCHEDULES

Parking spaces shall be provided in the minimum quantity specified in Column 2 hereunder for each use listed in Column 1, subject to the provisions of Subsection b) herein:

- a) Parking Schedule for All Downtown Zones

<u>Column 1</u>	<u>Column 2</u>	
i. Residential Uses		
Single Detached Dwelling, Semi-Detached Dwelling, Street Townhouse Dwelling Duplex Dwelling, Dwelling Unit	0 parking spaces per unit.	
a) Multiple Dwelling	Minimum	Maximum
i)	Dwelling units less than 50.0 square metres in gross floor area	
	Units 1-12	0 per unit
	Units 13+	0.3 per unit
		1.25 per unit

SECTION 5: PARKING

	ii)	Units greater than 50.0 square metres in gross floor area		
		Units 1-12	0 per unit	
		Units 13-50	0.5 per unit	1.25 per unit
		Units 51+	0.7 per unit	
	iii)	Units with 3 or more bedrooms		
		Units 1-12	0 per unit	1.25 per unit
		Units 13+	0.3 per unit	
b)	Residential Care Facility, Emergency Shelter, Lodging House, Retirement Home	1 for each 3 persons accommodated or designed for accommodation.		
ii. Institutional				
a)	Long Term Care Facility	1 for each 3 patient beds.		
b)	Day Nursery	i.	1 for each 125.0 square metres of gross floor area which accommodates such use.	
		ii.	Notwithstanding i. above, no parking shall be required where a Day Nursery is located within an Education Establishment.	
c)	Social Services Establishment	1 for each 50.0 square metres of gross floor area which accommodates such use.		
iii. Educational Establishments				
a)	Elementary School	1.25 for each classroom.		

	<p>(d) 1.0 for each three or more bedroom dwelling unit; and</p> <p>(ii) at a maximum rate of:</p> <p>(a) 0.4 for each bachelor dwelling unit up to 45 square metres and 1.2 for each bachelor dwelling unit greater than 45 square metres;</p> <p>(b) 0.7 for each one bedroom dwelling unit;</p> <p>(c) 1.2 for each two bedroom dwelling unit; and</p> <p>(d) 1.5 for each three or more bedroom dwelling unit; and</p> <p>(B) in Policy Area 2 (PA2) and Policy Area 3 (PA3):</p> <p>(i) at a minimum rate of :</p> <p>(a) 0.6 for each bachelor dwelling unit up to 45 square metres and 1.0 for each bachelor dwelling unit greater than 45 square metres;</p> <p>(b) 0.7 for each one bedroom dwelling unit;</p> <p>(c) 0.9 for each two bedroom dwelling unit; and</p> <p>(d) 1.0 for each three or more bedroom dwelling unit; and</p> <p>(ii) at a maximum rate of:</p> <p>(a) 0.9 for each bachelor dwelling unit up to 45 square metres and 1.3 for each bachelor dwelling unit greater than 45 square metres;</p> <p>(b) 1.0 for each one bedroom dwelling unit;</p> <p>(c) 1.3 for each two bedroom dwelling unit; and</p> <p>(d) 1.5 for each three or more bedroom dwelling unit; and</p> <p>(C) in Policy Area 4 (PA4):</p> <p>(i) at a minimum rate of :</p> <p>(a) 0.7 for each bachelor dwelling unit up to 45 square metres and 1.0 for each bachelor dwelling unit greater than 45 square metres;</p> <p>(b) 0.8 for each one bedroom dwelling unit;</p> <p>(c) 0.9 for each two bedroom dwelling unit; and</p> <p>(d) 1.1 for each three or more bedroom dwelling unit; and</p> <p>(ii) at a maximum rate of:</p> <p>(a) 1.0 for each bachelor dwelling unit up to 45 square metres and 1.3 for each bachelor dwelling unit greater than 45 square metres;</p> <p>(b) 1.2 for each one bedroom dwelling unit;</p> <p>(c) 1.3 for each two bedroom dwelling unit; and</p> <p>(d) 1.6 for each three or more bedroom dwelling unit; and</p> <p>(D) in all other areas of the City:</p> <p>(i) at a minimum rate of :</p> <p>(a) 0.8 for each bachelor dwelling unit up to 45 square metres and 1.0 for each bachelor dwelling unit greater than 45 square metres;</p> <p>(b) 0.9 for each one bedroom dwelling unit;</p> <p>(c) 1.0 for each two bedroom dwelling unit; and</p> <p>(d) 1.2 for each three or more bedroom dwelling unit.</p>			
Dwelling unit in an Apartment Building – (Visitor requirement)	For a dwelling unit in an Apartment Building, parking spaces for visitors must be provided:	10%	35%	100%
	<p>(A) in Policy Area 1 (PA1) at a minimum rate of 0.1 for each dwelling unit;</p> <p>(B) in Policy Area 2 (PA2) at a minimum rate of 0.1 for each dwelling unit;</p> <p>(C) in Policy Area 3 (PA3) at a minimum rate of 0.1 for each dwelling unit;</p> <p>(D) in Policy Area 4 (PA4) at a minimum rate of 0.15 for each dwelling unit; and</p> <p>(E) in all other areas of the City at a minimum rate of 0.2 for each dwelling unit.</p>			
Dwelling unit in a Mixed Use Building	Parking spaces are to be provided at the same rate as a Dwelling unit in an Apartment Building. (Tenant Requirement) [1675-2013]	100%	100%	100%
Dwelling unit in a Mixed Use Building Visitor Parking	For a dwelling unit in an Mixed Use Building, parking spaces for visitors must be provided:	10%	35%	100%
